Transformer Model

- Transformer is a Seq2Seq model.
- Transformer is not RNN.
- Purely based attention and fully-connected layers.
- Much more computations than RNNs.
- Higher performance than RNNs on large datasets.

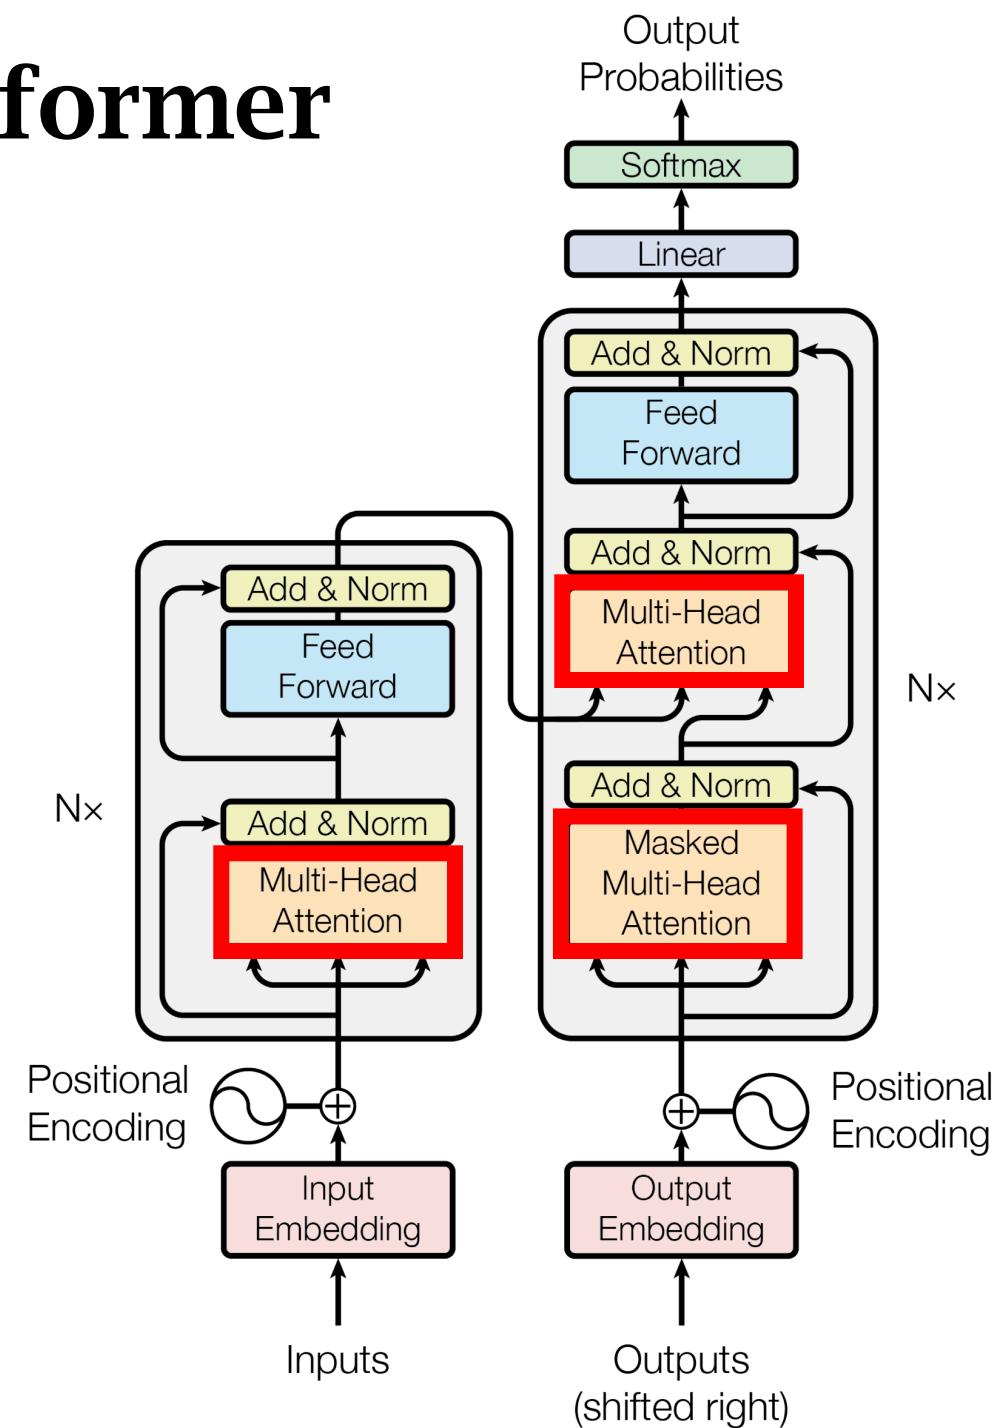

Attention beyond RNNs

Attention in Transformer

Multi-head attention:

- Multiple **single-head attentions**, each has its own parameter matrices.
- Concatenate the outputs.

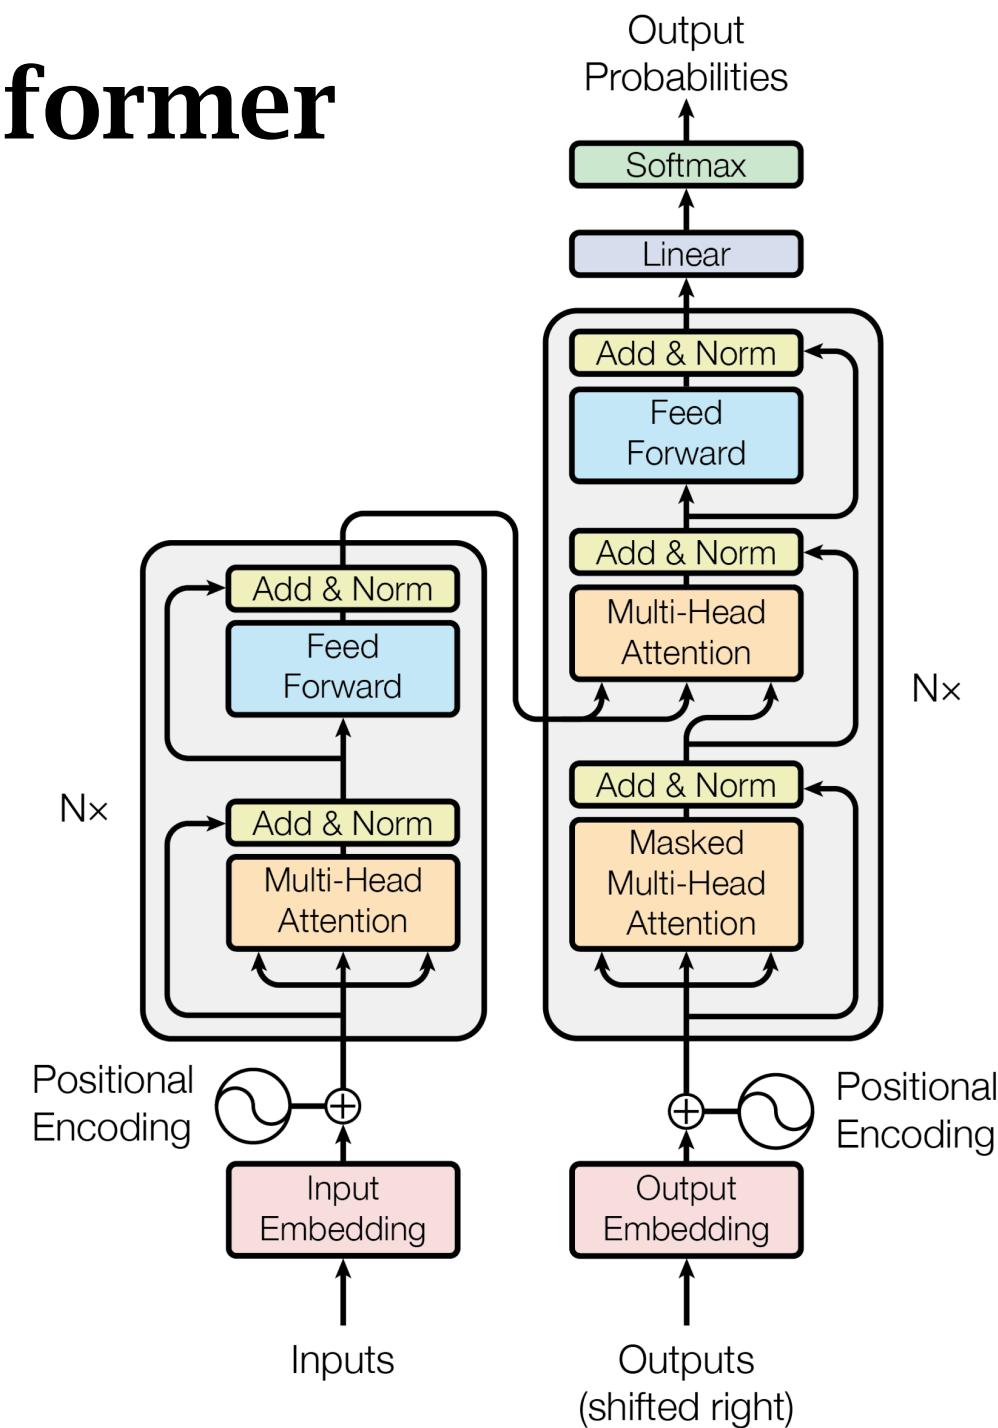

Attention in Transformer

Multi-head attention:

- Multiple single-head attentions, each has its own parameter matrices.
- Concatenate the outputs.

Single-head attention:

- $C = \text{Attn}(Q, K, V)$.
-
- The diagram illustrates a single-head attention mechanism. It shows three inputs: 'query' (red), 'key' (green), and 'value' (purple). These inputs are processed by a single-head attention block, which is represented by a box containing 'Multi-Head Attention' and 'Add & Norm' layers. The output of this block is then passed through a 'Feed Forward' layer and another 'Add & Norm' layer before being concatenated with the original input. The final output is labeled 'C'.

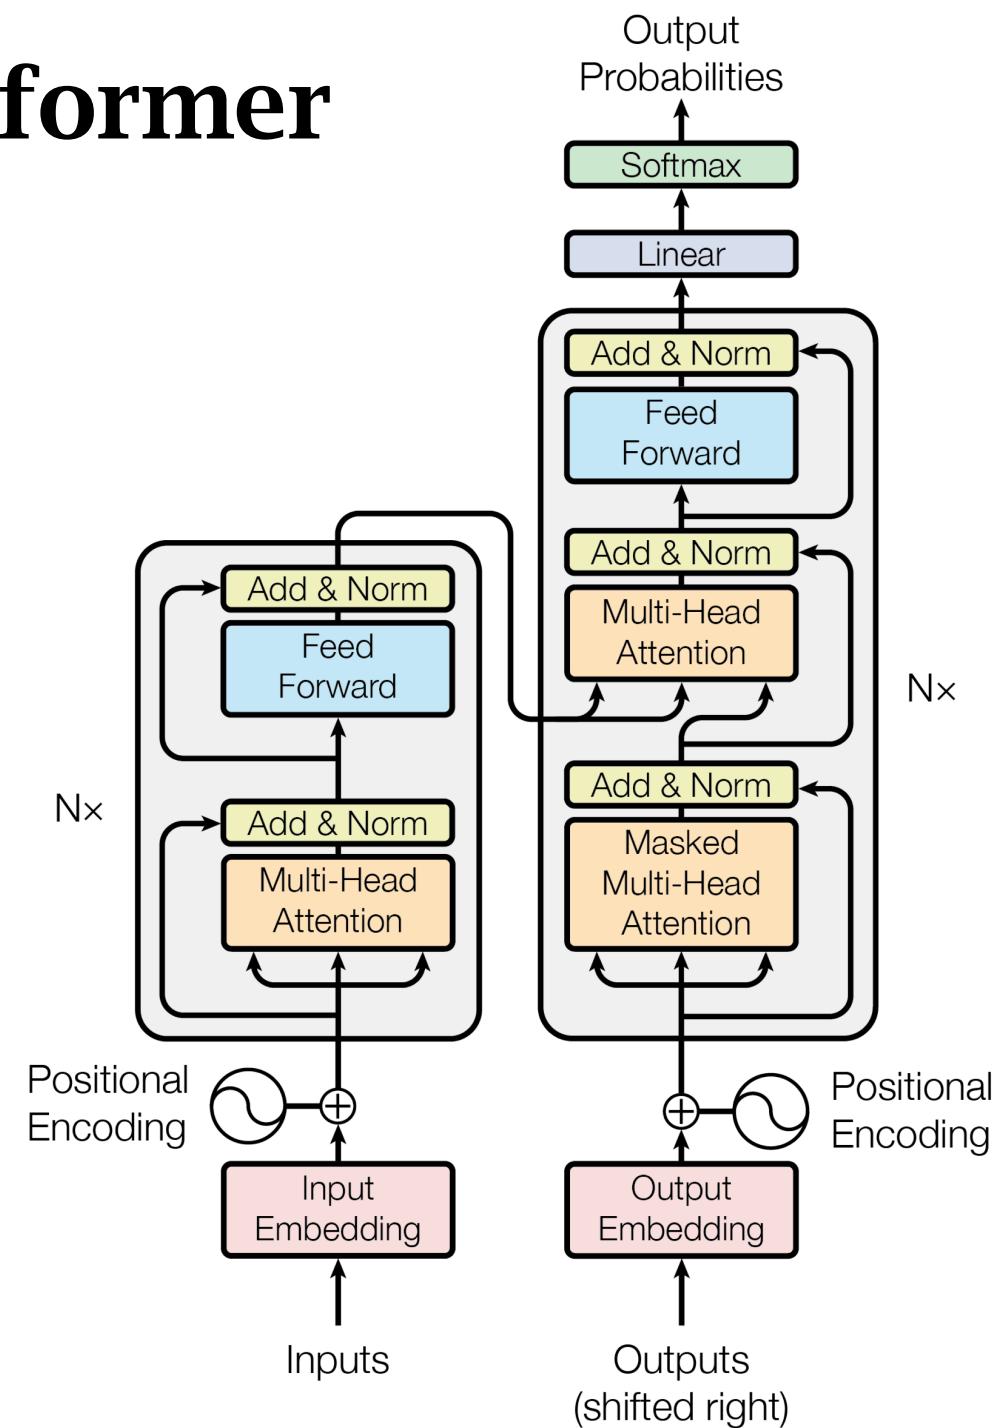

Attention in Transformer

Multi-head attention:

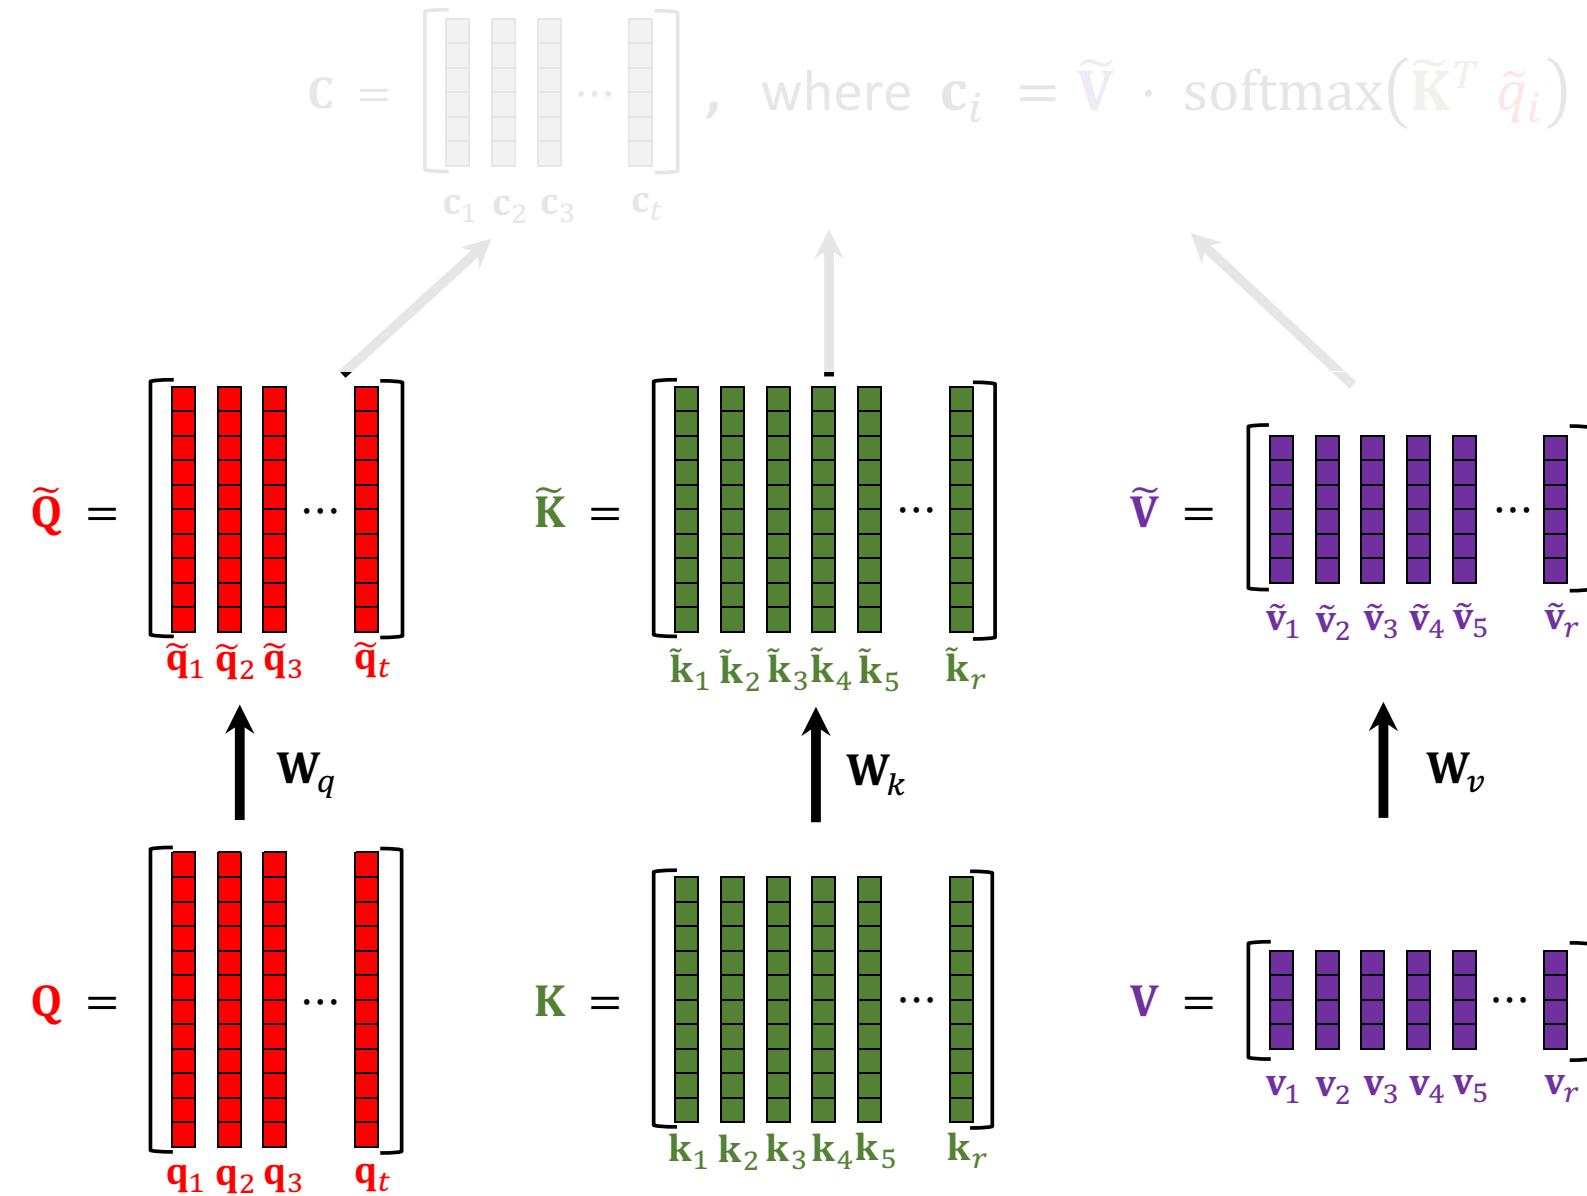

- Multiple single-head attentions, each has its own parameter matrices.
- Concatenate the outputs.

Single-head attention:

- $C = \text{Attn}(Q, K, V)$.
- Q and C have t columns.
- t : sequence length.
- K and V have r columns (r is arbitrary).

Single-Head Attention: $\mathbf{C} = \text{Attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$.

Linear maps:

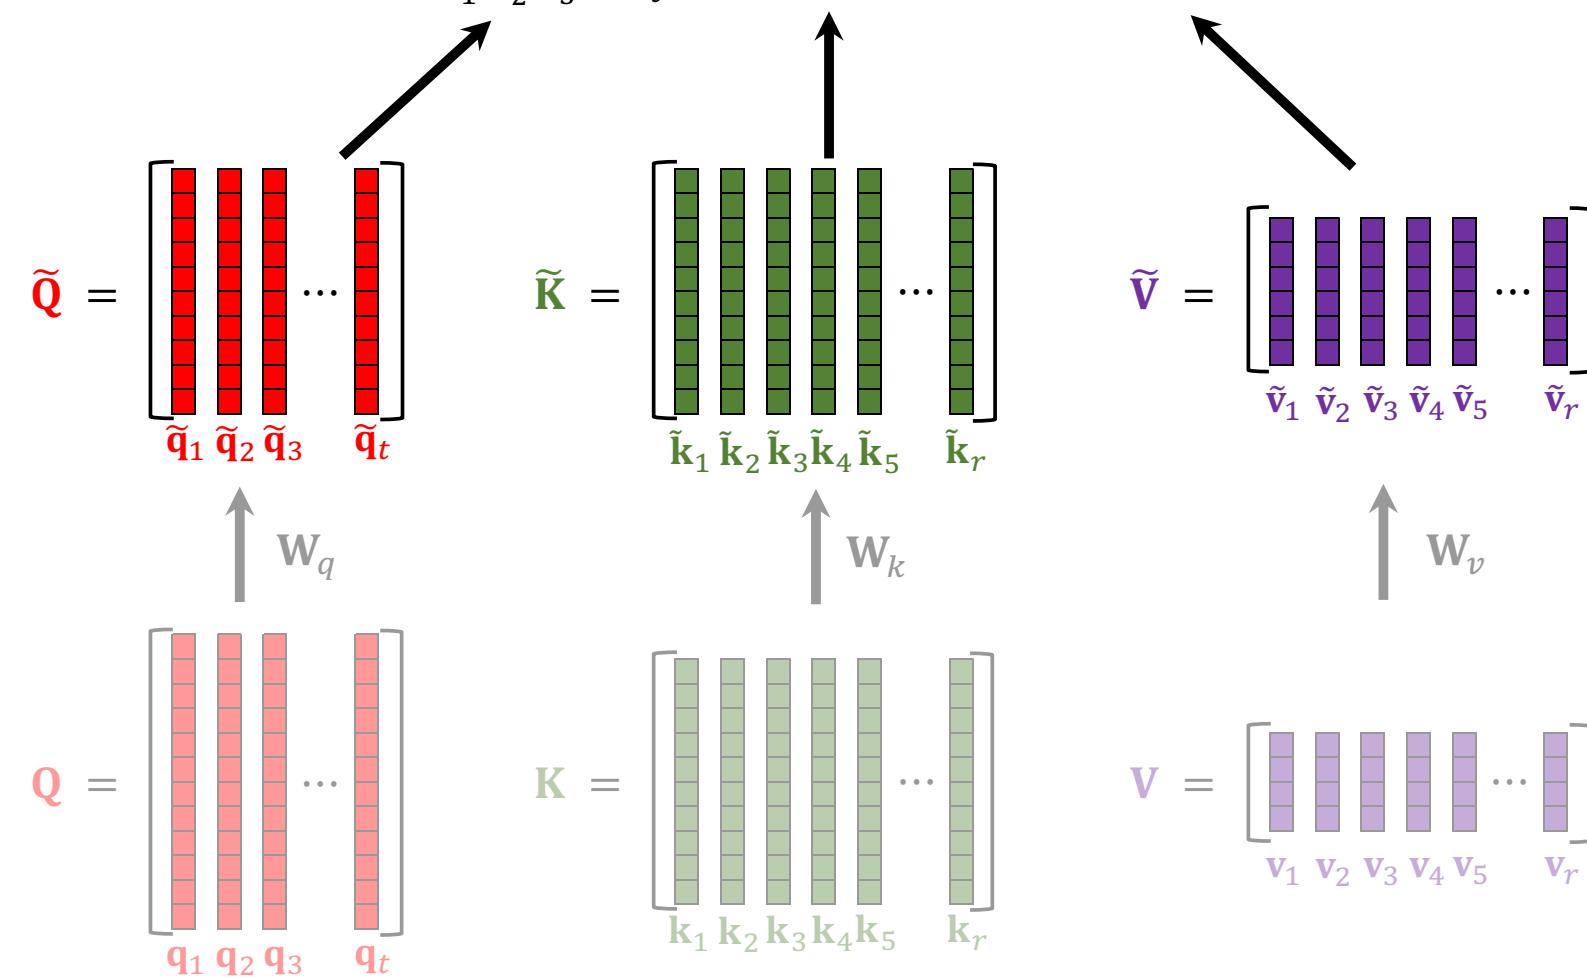

- $\tilde{\mathbf{Q}} = \mathbf{W}_q \mathbf{Q}$,
- $\tilde{\mathbf{K}} = \mathbf{W}_k \mathbf{K}$,
- $\tilde{\mathbf{V}} = \mathbf{W}_v \mathbf{V}$.

Trainable parameters:

- $\mathbf{W}_q, \mathbf{W}_k, \mathbf{W}_v$.

Single-Head Attention: $\mathbf{C} = \text{Attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$.

$$\mathbf{c} = \begin{bmatrix} \vdots & \vdots & \vdots & \cdots & \vdots \\ \mathbf{c}_1 & \mathbf{c}_2 & \mathbf{c}_3 & & \mathbf{c}_t \end{bmatrix}, \text{ where } \mathbf{c}_i = \tilde{\mathbf{V}} \cdot \text{softmax}(\tilde{\mathbf{K}}^T \tilde{\mathbf{q}}_i)$$

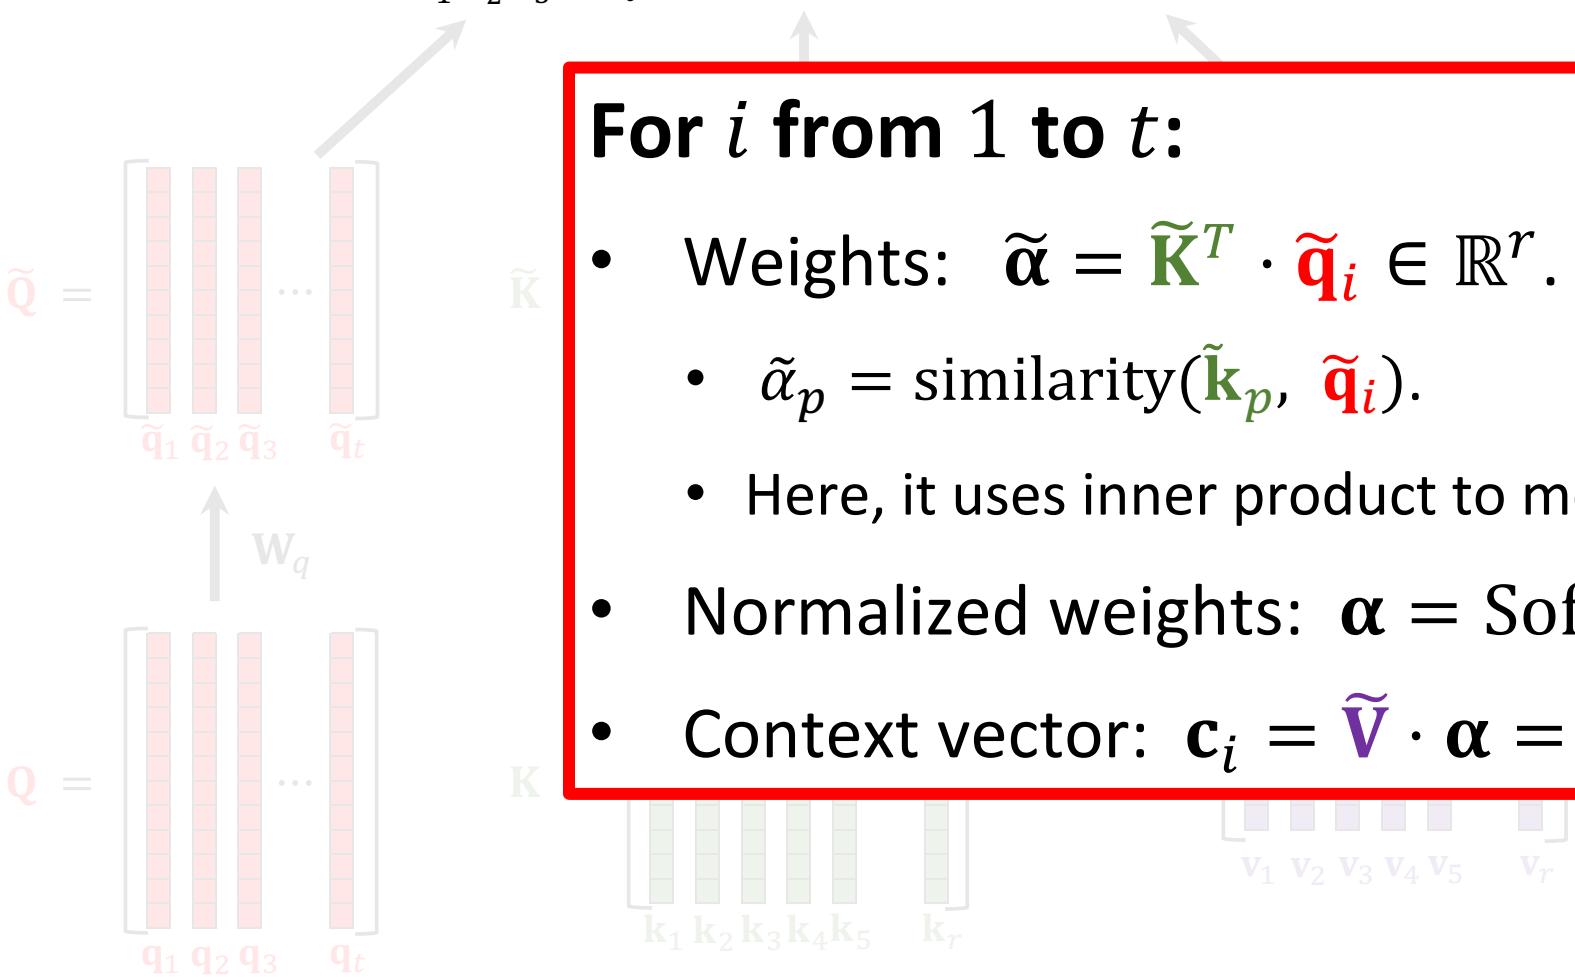

Single-Head Attention: $C = \text{Attn}(Q, K, V)$.

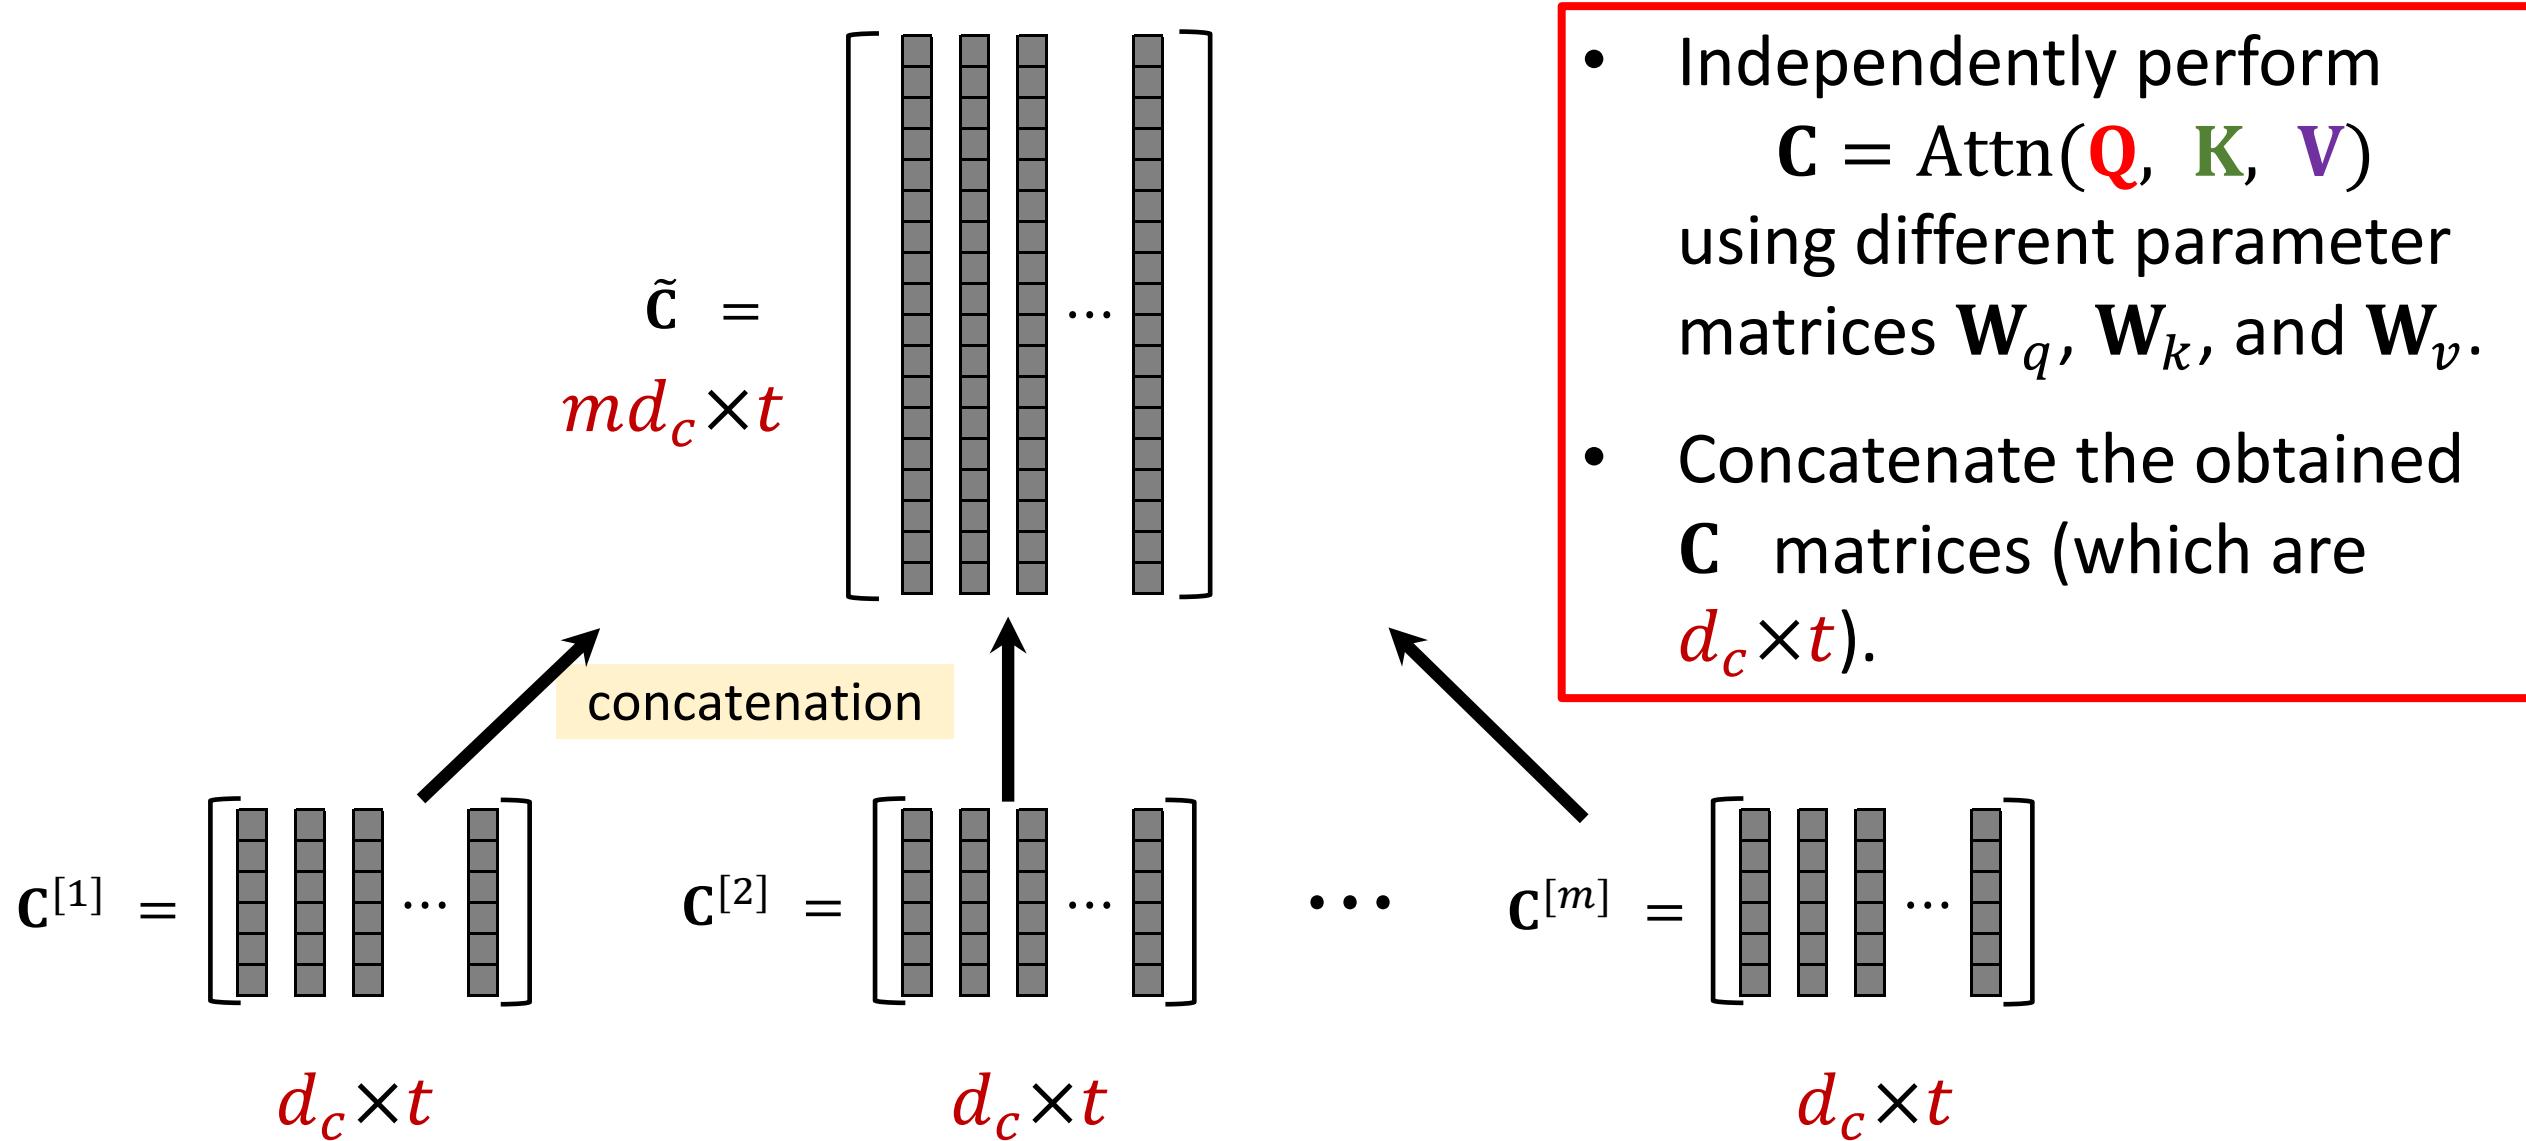

$$C = \begin{bmatrix} \vdots & \vdots & \vdots & \cdots & \vdots \\ c_1 & c_2 & c_3 & \cdots & c_t \end{bmatrix}, \text{ where } c_i = \tilde{V} \cdot \text{softmax}(\tilde{K}^T \tilde{q}_i)$$

For i from 1 to t :

- Weights: $\tilde{\alpha} = \tilde{K}^T \cdot \tilde{q}_i \in \mathbb{R}^r$.
 - $\tilde{\alpha}_p = \text{similarity}(\tilde{k}_p, \tilde{q}_i)$.
 - Here, it uses inner product to measure similarity.
- Normalized weights: $\alpha = \text{Softmax}(\tilde{\alpha})$.
- Context vector: $c_i = \tilde{V} \cdot \alpha = \alpha_1 \tilde{v}_1 + \cdots + \alpha_r \tilde{v}_r$.

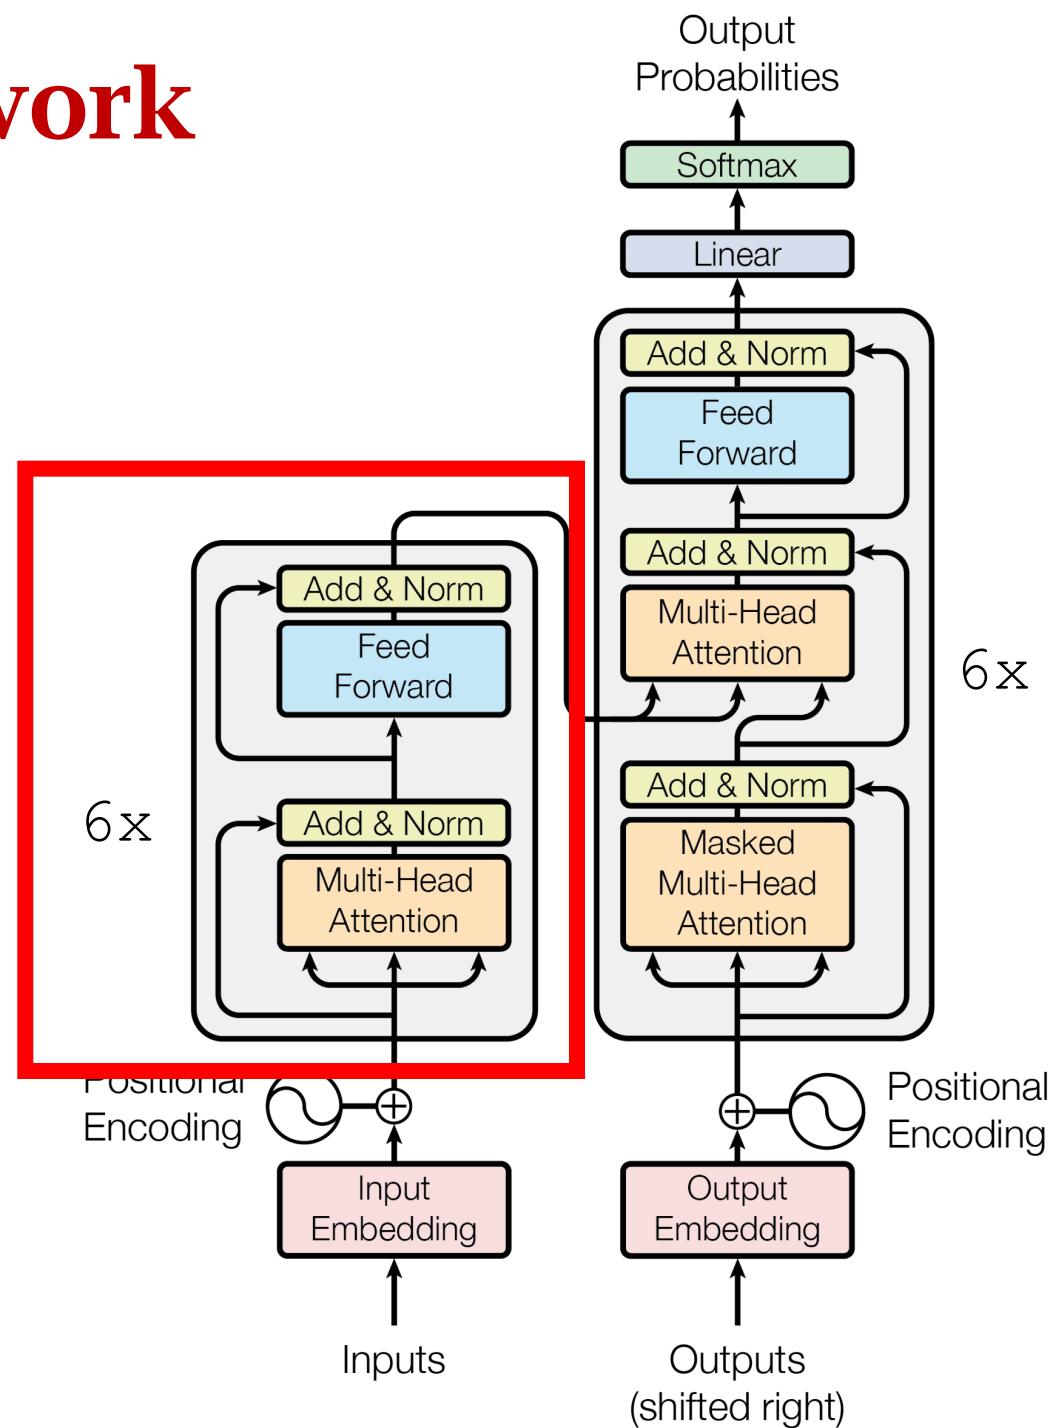

Multi-Head Attention

Encoder of Transformer

Encoder Network

- Encoder has 6 **blocks**.
- 1 Block = **Multi-head attention + Dense**.
- 6 is the result of hyper-parameter tuning; nothing magical about 6.
- Other tricks:
 - Skip connection.
 - Normalization.

Multi-Head Attention + Dense Layer

Multi-Head Attention

$$\tilde{\mathbf{C}} = [\tilde{\mathbf{c}}_1, \tilde{\mathbf{c}}_2, \tilde{\mathbf{c}}_3, \dots, \tilde{\mathbf{c}}_t] \in \mathbb{R}^{md_c \times t}$$

Concatenation

$$\mathbf{C}^{[1]} \in \mathbb{R}^{d_c \times t}$$

$$\mathbf{C}^{[2]} \in \mathbb{R}^{d_c \times t}$$

...

$$\mathbf{C}^{[m]} \in \mathbb{R}^{d_c \times t}$$

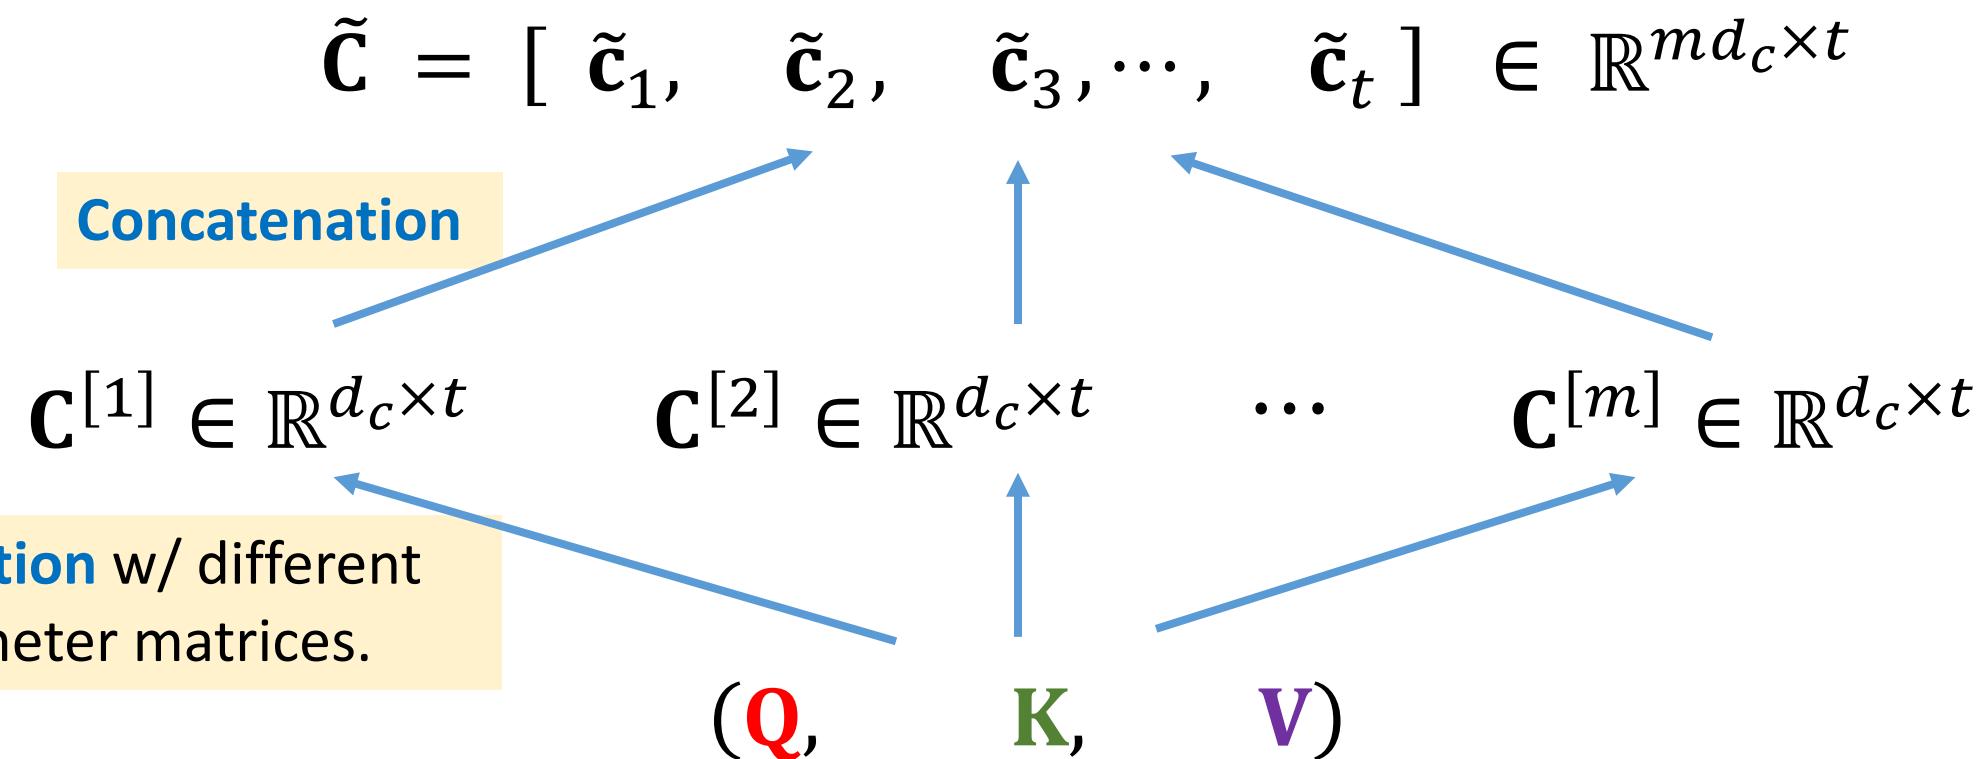

Attention w/ different
parameter matrices.

$$(\mathbf{Q}, \mathbf{K}, \mathbf{V})$$

Multi-Head Attention + Dense Layer

$\tilde{\mathbf{C}}$'s number of columns, t , is determined by \mathbf{Q} .

Multi-Head Attention

Multi-Head Attention + Dense Layer

$$\tilde{\mathbf{U}} = [\tilde{\mathbf{u}}_1, \tilde{\mathbf{u}}_2, \tilde{\mathbf{u}}_3, \dots, \tilde{\mathbf{u}}_t] \in \mathbb{R}^{d_u \times t}$$

Dense layer is applied to every column independently.

$$\tilde{\mathbf{C}} = [\tilde{\mathbf{c}}_1, \tilde{\mathbf{c}}_2, \tilde{\mathbf{c}}_3, \dots, \tilde{\mathbf{c}}_t] \in \mathbb{R}^{md_c \times t}$$

Concatenation

$$\mathbf{C}^{[1]} \in \mathbb{R}^{d_c \times t}$$

$$\mathbf{C}^{[2]} \in \mathbb{R}^{d_c \times t}$$

...

$$\mathbf{C}^{[m]} \in \mathbb{R}^{d_c \times t}$$

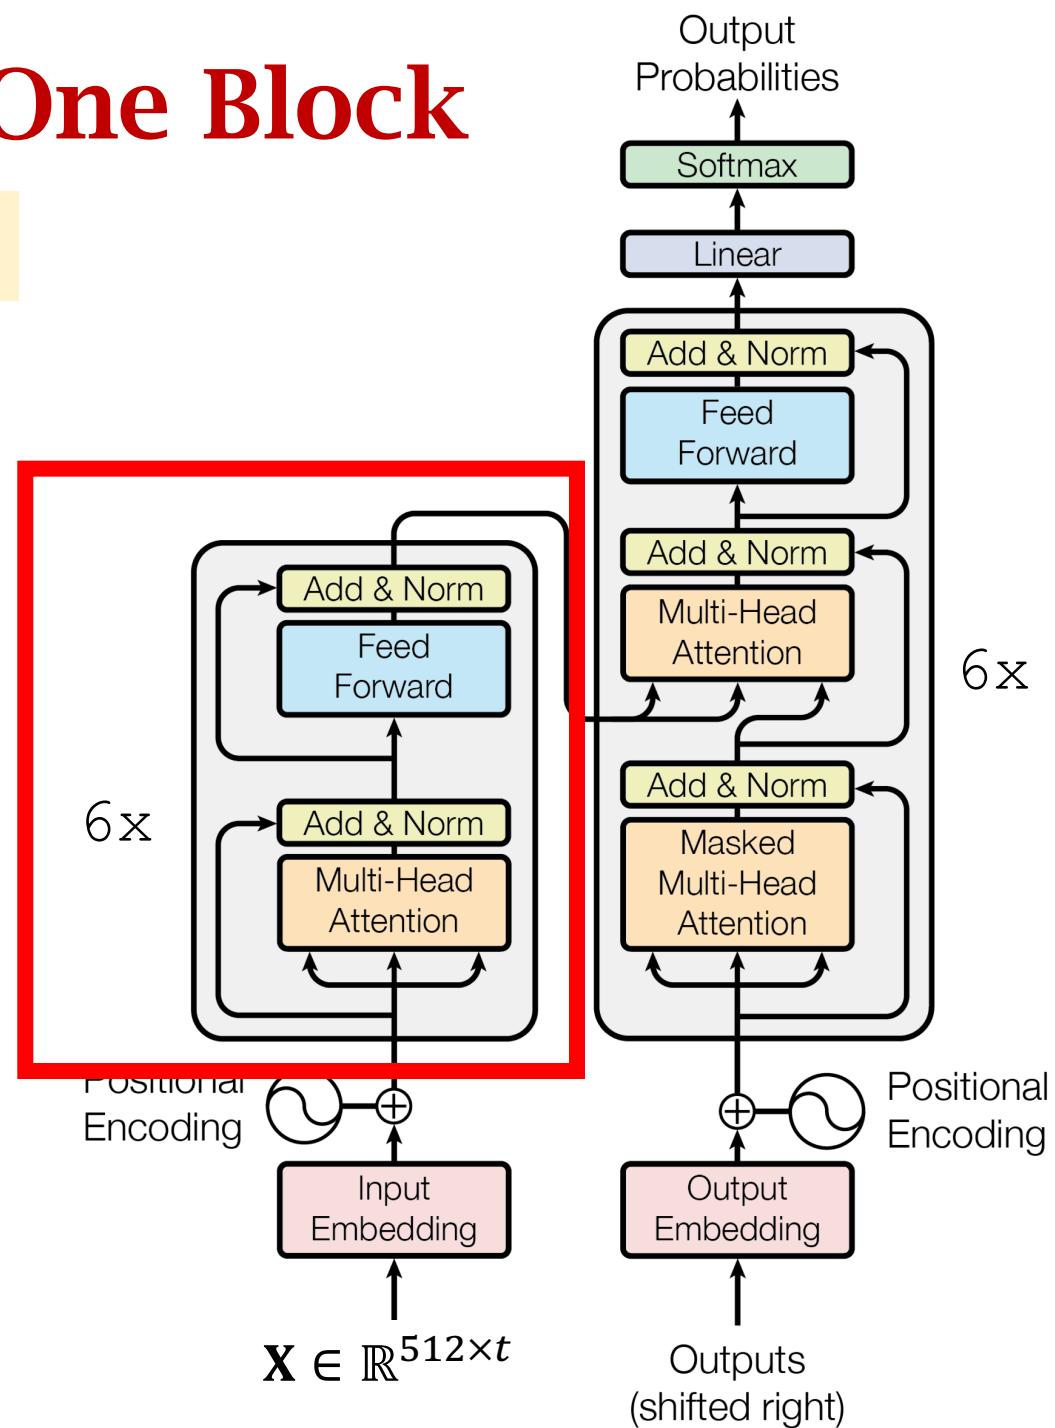

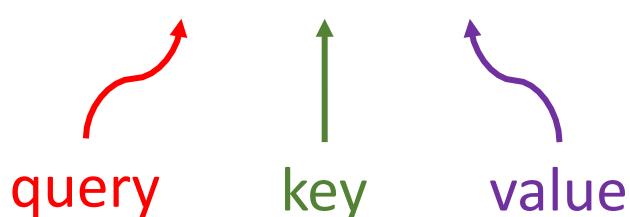

Attention w/ different parameter matrices.

$$(\mathbf{Q}, \mathbf{K}, \mathbf{V})$$

Encoder Network: One Block

Ignore skip connection and normalization.

- Input: $\mathbf{X} \in \mathbb{R}^{512 \times t}$; (t is the seq length.)
- Set $\mathbf{Q} = \mathbf{K} = \mathbf{V} = \mathbf{X}$.

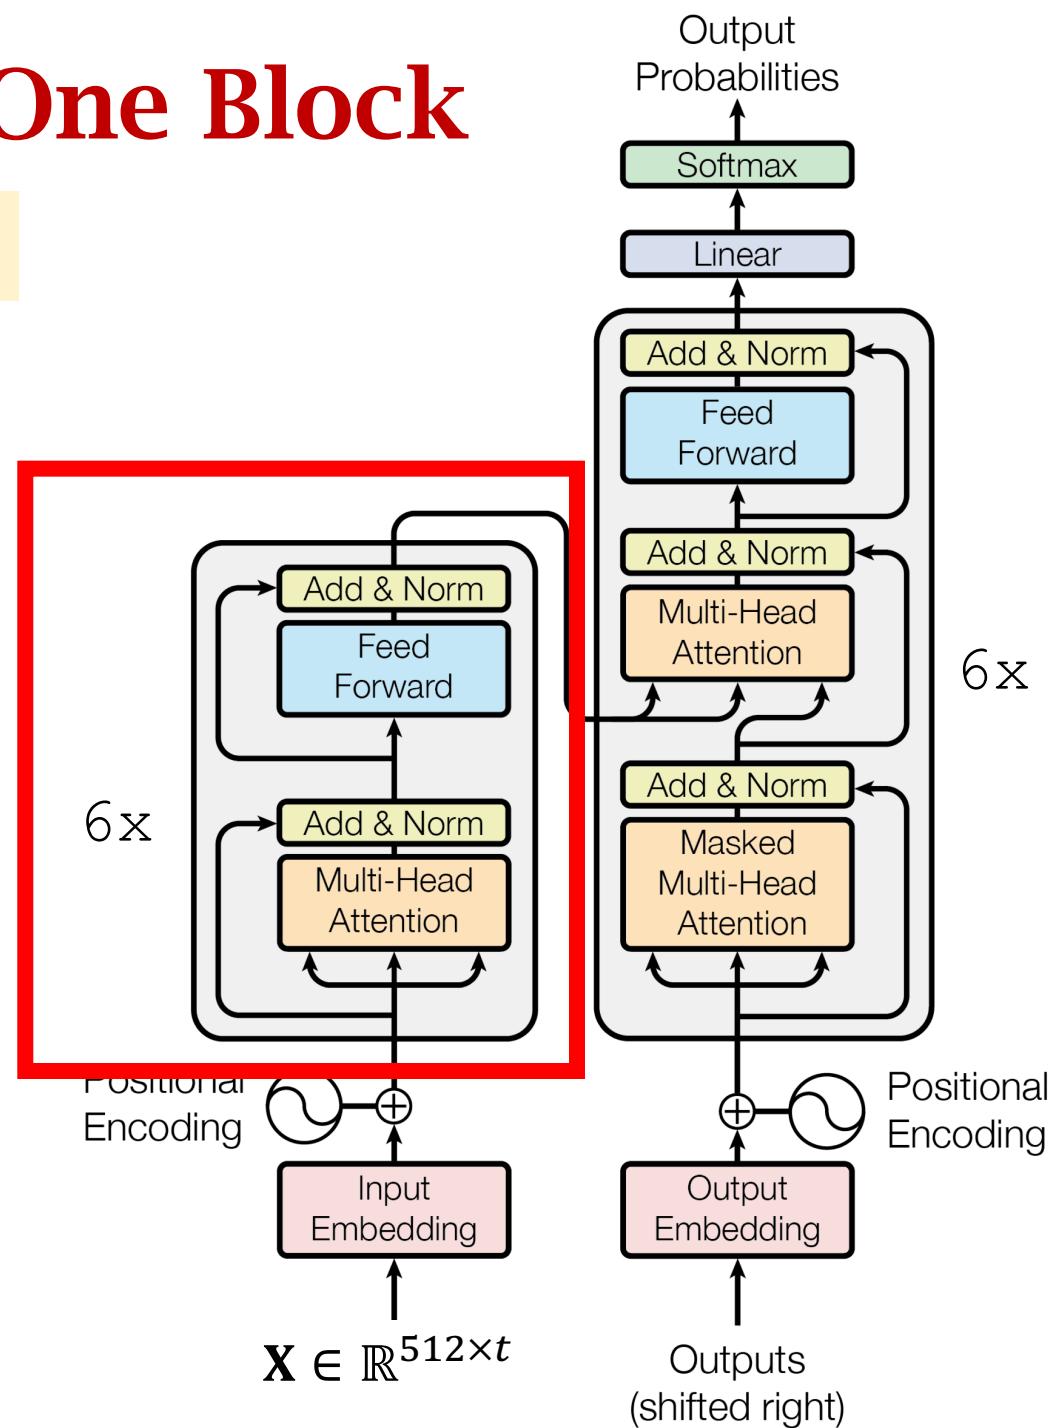

Encoder Network: One Block

Ignore skip connection and normalization.

- Input: $\mathbf{X} \in \mathbb{R}^{512 \times t}$; (t is the seq length.)
- Set $\mathbf{Q} = \mathbf{K} = \mathbf{V} = \mathbf{X}$.
- Repeat $m = 8$ times:
$$\mathbf{C}^{[i]} = \text{Attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V}) \in \mathbb{R}^{64 \times t}.$$
- $\tilde{\mathbf{C}} = \text{Concatenate}(\mathbf{C}^{[1]}, \dots, \mathbf{C}^{[m]}) \in \mathbb{R}^{512 \times t}.$

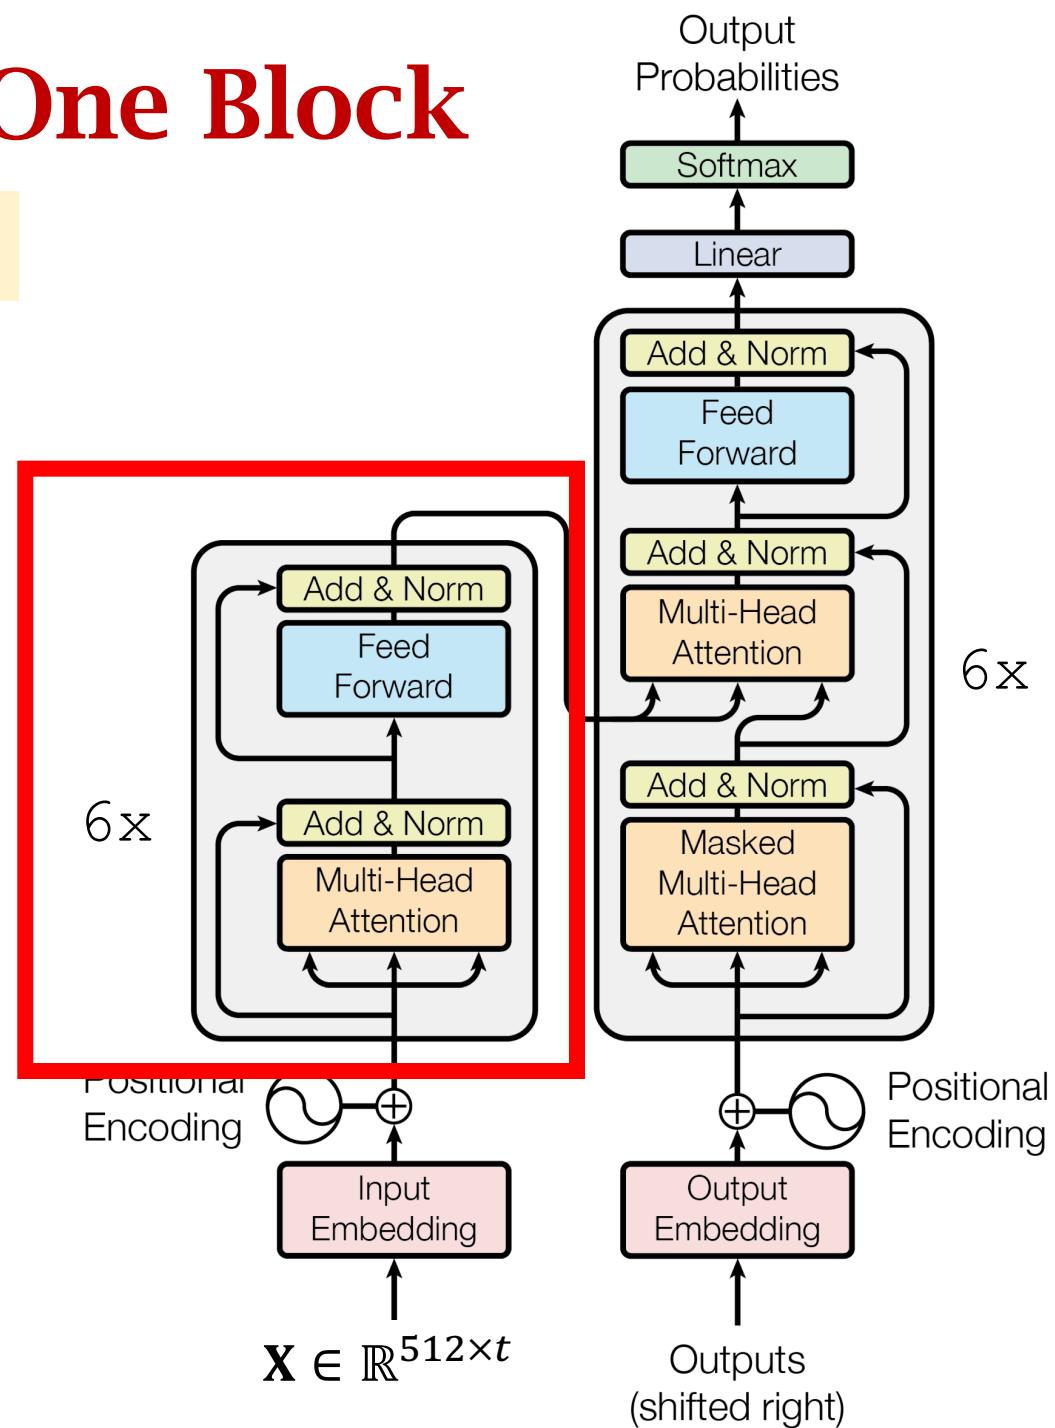

- Make sure the **input shape** and **output shape** are the same.
- Otherwise, skip connection cannot be applied.

Encoder Network: One Block

Ignore skip connection and normalization.

- Input: $\mathbf{X} \in \mathbb{R}^{512 \times t}$; (t is the seq length.)
- Set $\mathbf{Q} = \mathbf{K} = \mathbf{V} = \mathbf{X}$.
- Repeat $m = 8$ times:
$$\mathbf{C}^{[i]} = \text{Attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V}) \in \mathbb{R}^{64 \times t}.$$
- $\tilde{\mathbf{C}} = \text{Concatenate}(\mathbf{C}^{[1]}, \dots, \mathbf{C}^{[m]}) \in \mathbb{R}^{512 \times t}.$
- $\tilde{\mathbf{U}} = \text{DenseLayer}(\tilde{\mathbf{C}}) \in \mathbb{R}^{512 \times t}.$
- Output: $\tilde{\mathbf{U}} \in \mathbb{R}^{512 \times t}$. (The same shape as \mathbf{X} .)

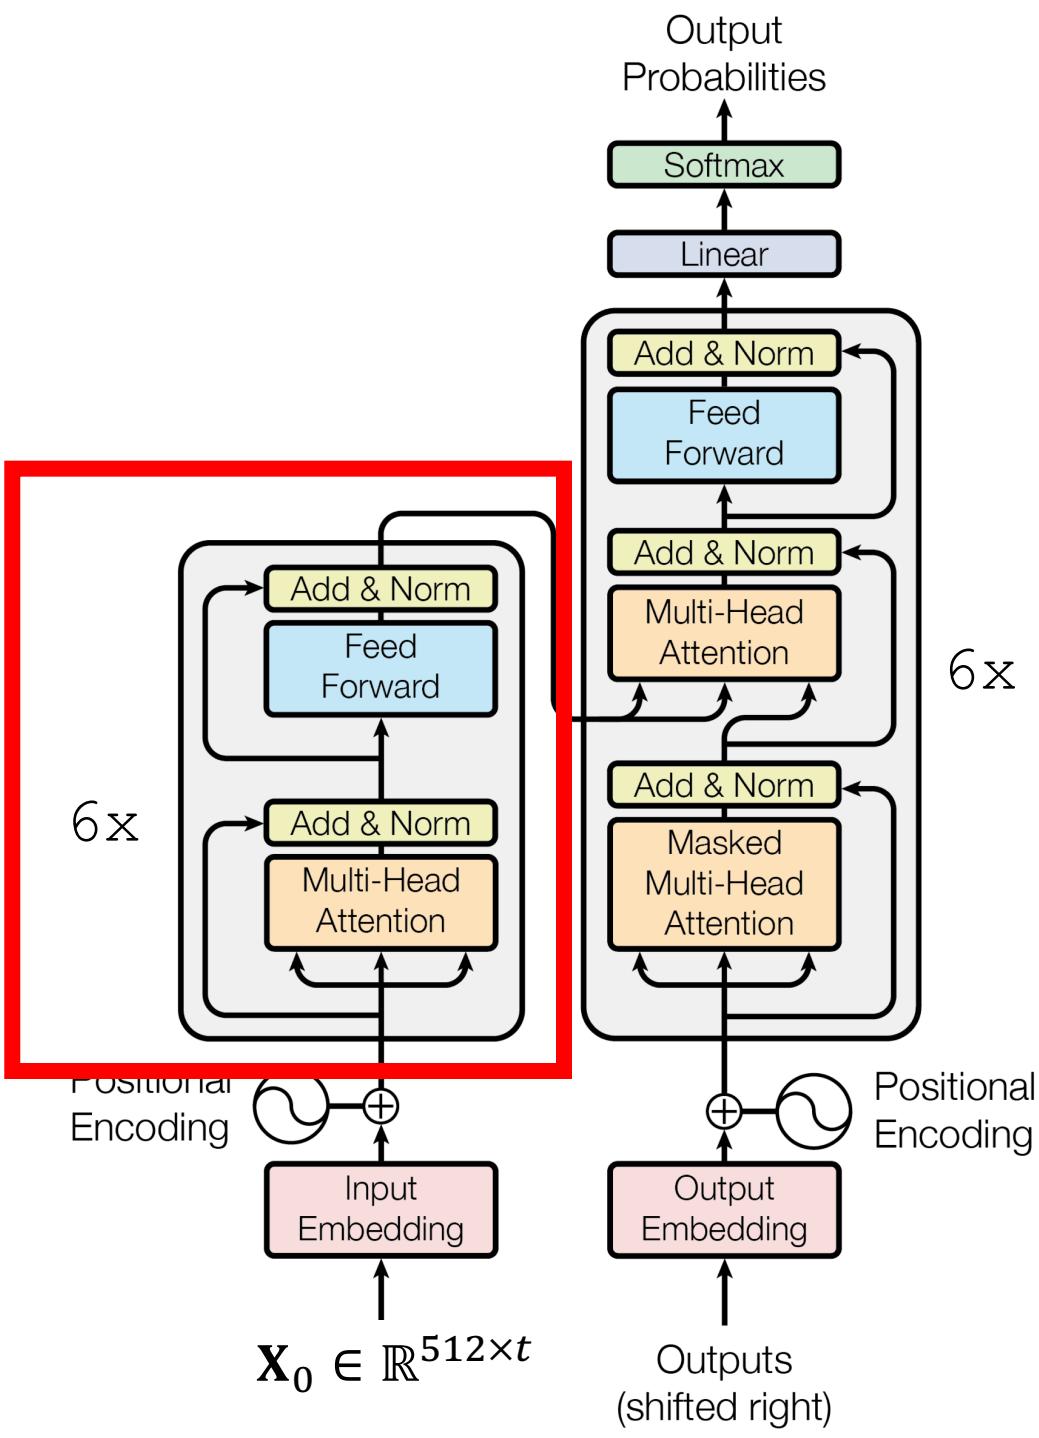

Encoder Network

$$\mathbf{X}_{(1)} \in \mathbb{R}^{512 \times t}$$

Block 1

$$\mathbf{X}_{(0)} \in \mathbb{R}^{512 \times t}$$

Encoder Network

Encoder

$$\mathbf{X}_{(6)} \in \mathbb{R}^{512 \times t}$$

Block 6

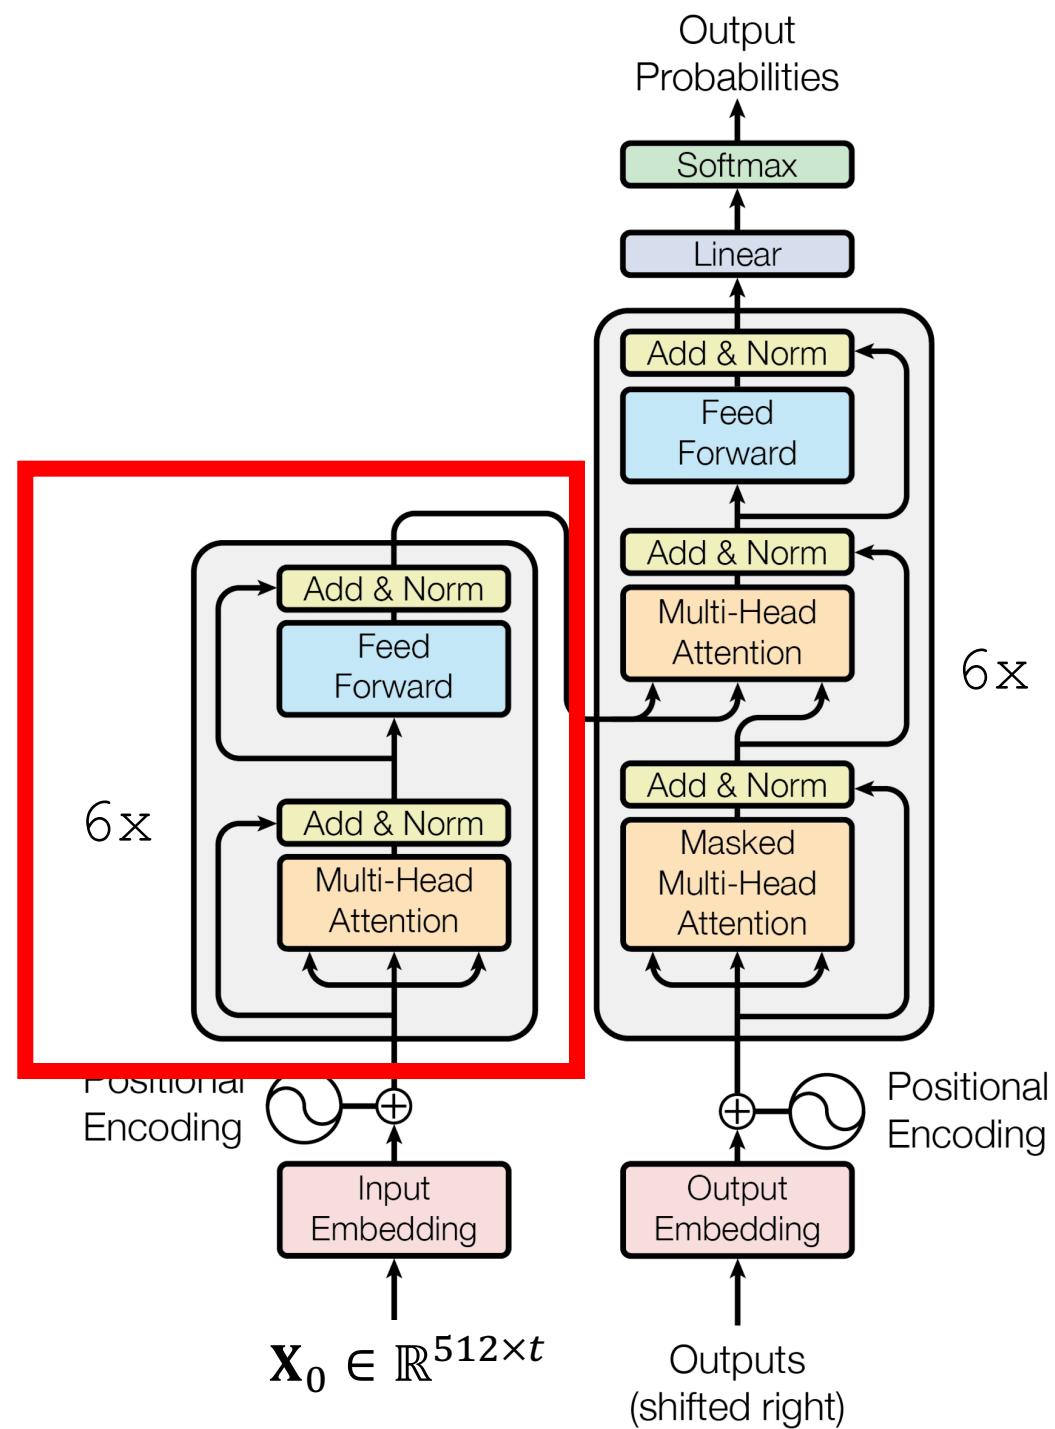

Block 2

$$\mathbf{X}_{(1)} \in \mathbb{R}^{512 \times t}$$

Block 1

$$\mathbf{X}_{(0)} \in \mathbb{R}^{512 \times t}$$

Decoder of Transformer

Decoder Network: One Block

Encoder

$$X_{(6)} \in \mathbb{R}^{512 \times t}$$

Block 6

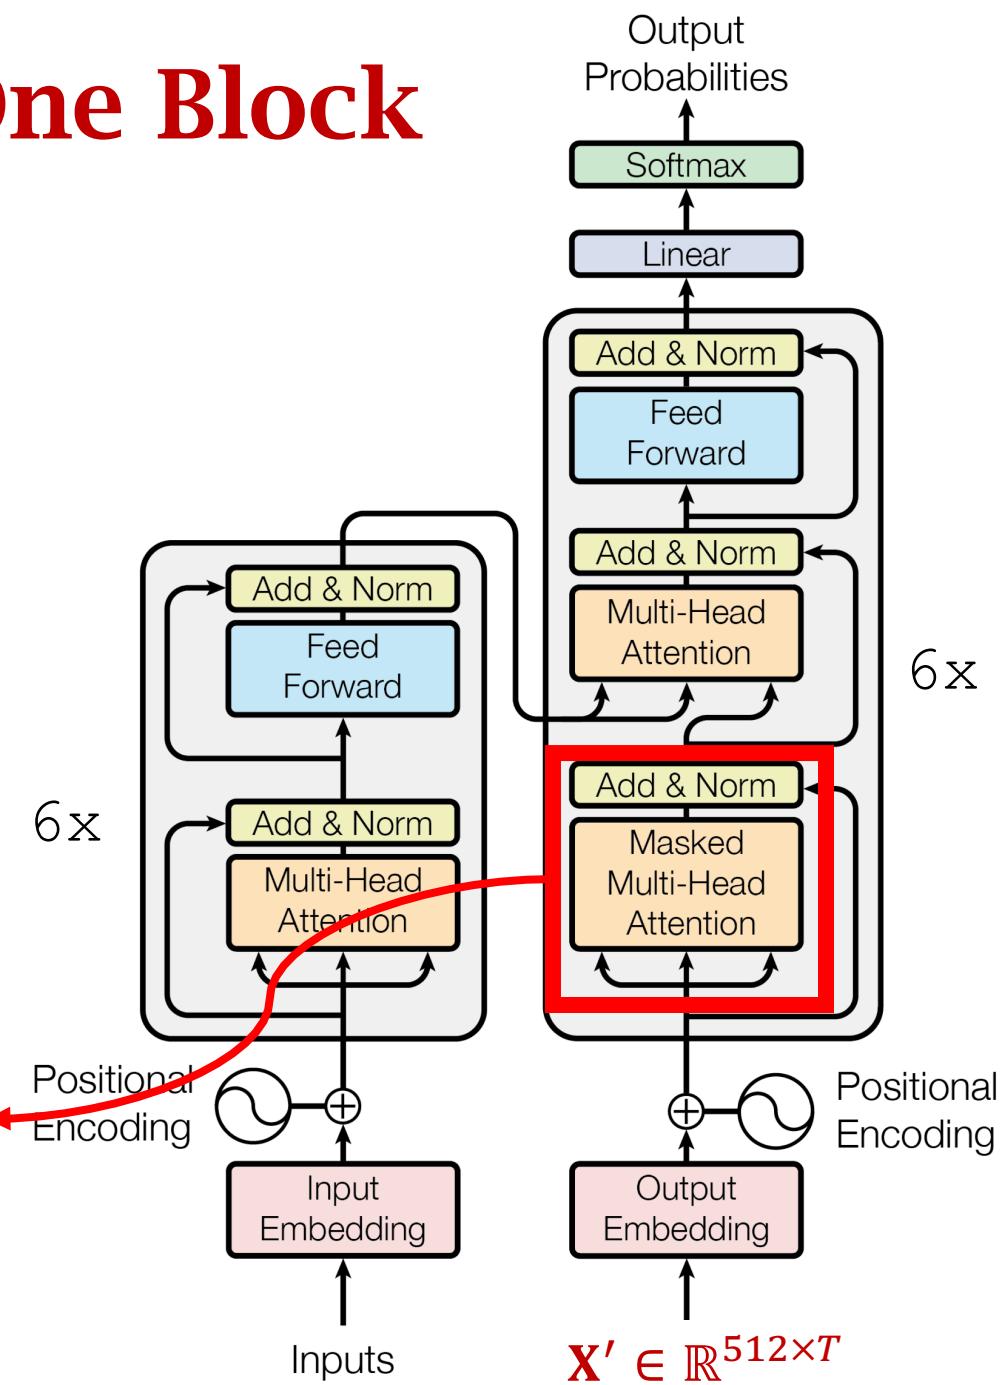

Block 2

$$X_{(1)} \in \mathbb{R}^{512 \times t}$$

Block 1

$$X_{(0)} \in \mathbb{R}^{512 \times t}$$

- Similar to encoder.
- Set $Q = K = V = X'$.

Decoder Network: One Block

Encoder

$$\mathbf{X}_{(6)} \in \mathbb{R}^{512 \times t}$$

Block 6

Block 2

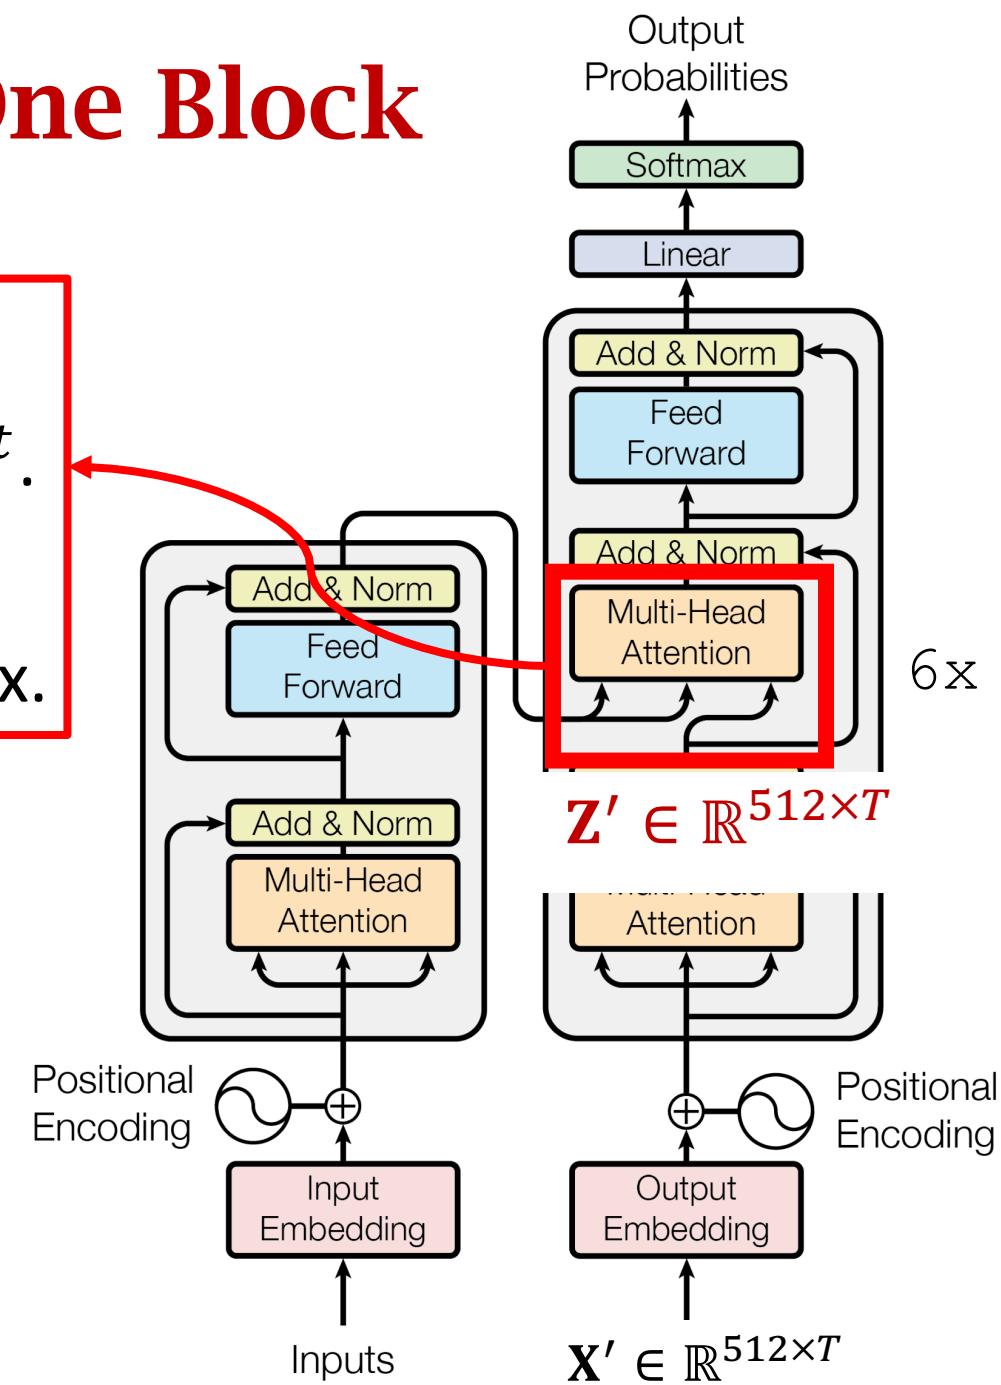

$$\mathbf{X}_{(1)} \in \mathbb{R}^{512 \times t}$$

Block 1

$$\mathbf{X}_{(0)} \in \mathbb{R}^{512 \times t}$$

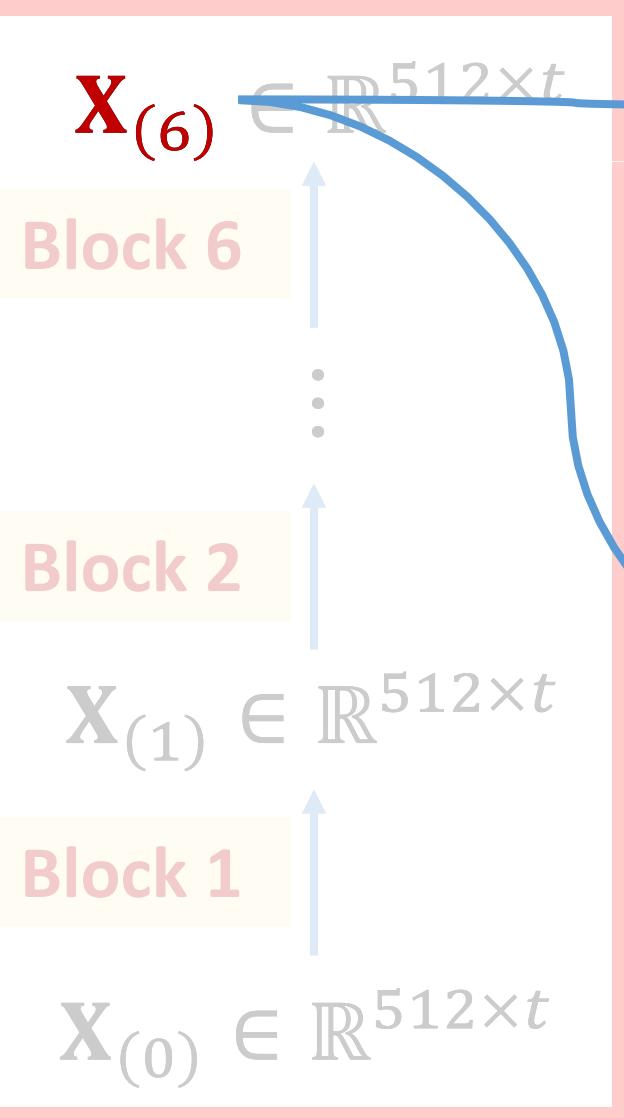

- Set $\mathbf{Q} = \mathbf{Z}' \in \mathbb{R}^{512 \times T}$.
- $\mathbf{K} = \mathbf{V} = \mathbf{X}_{(6)} \in \mathbb{R}^{512 \times t}$.
- Multi-head attention outputs a $512 \times T$ matrix.

- Similar to encoder.
- Set $\mathbf{Q} = \mathbf{K} = \mathbf{V} = \mathbf{X}'$.

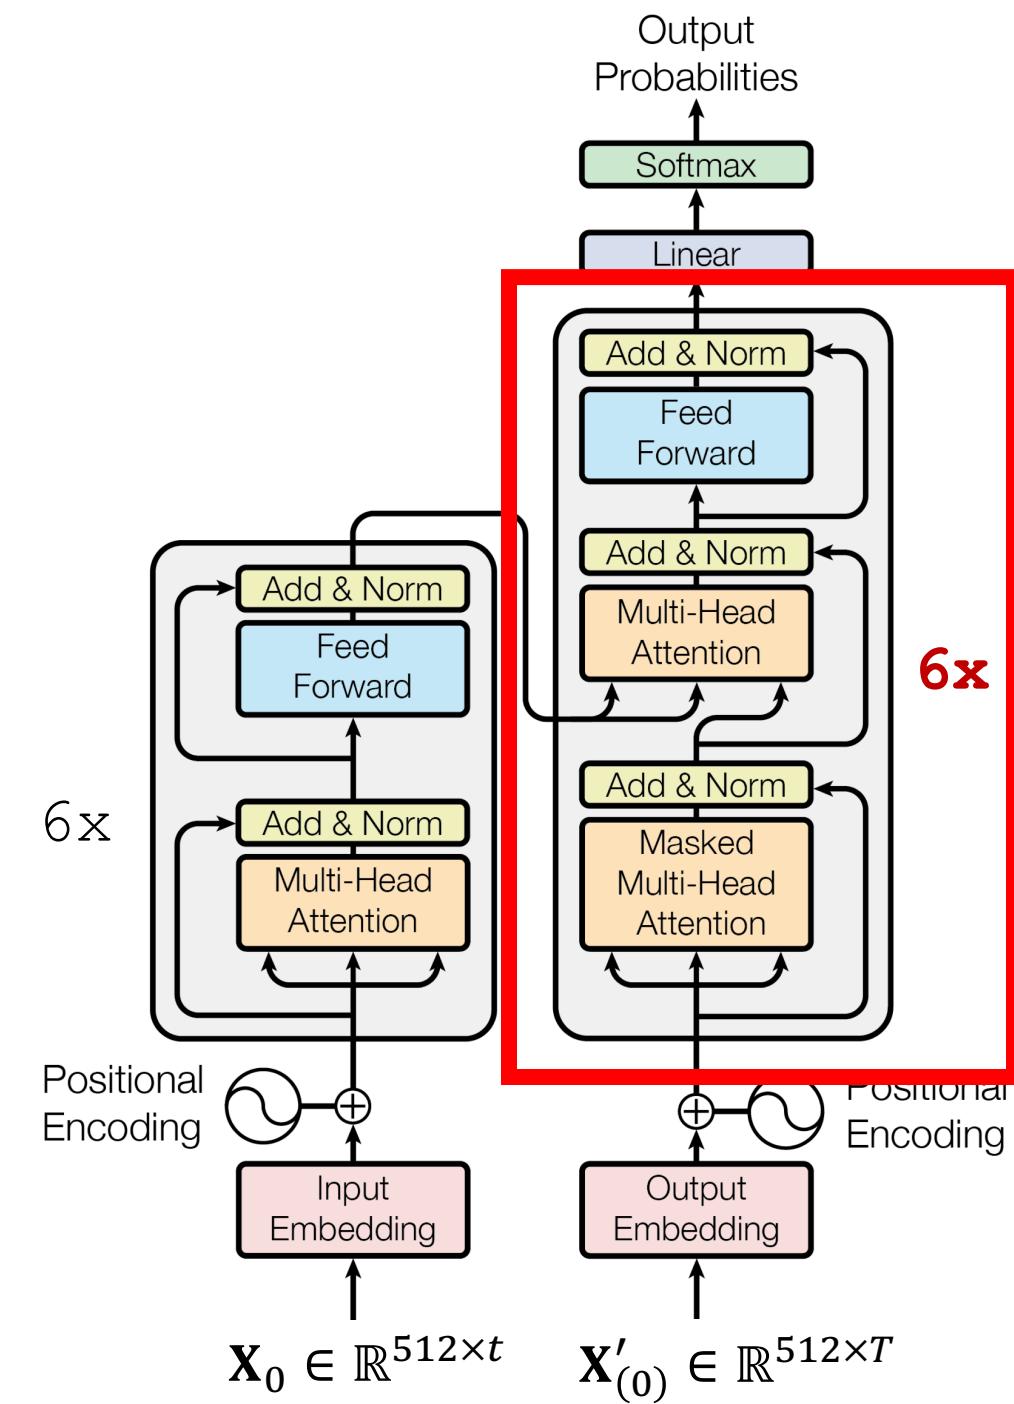

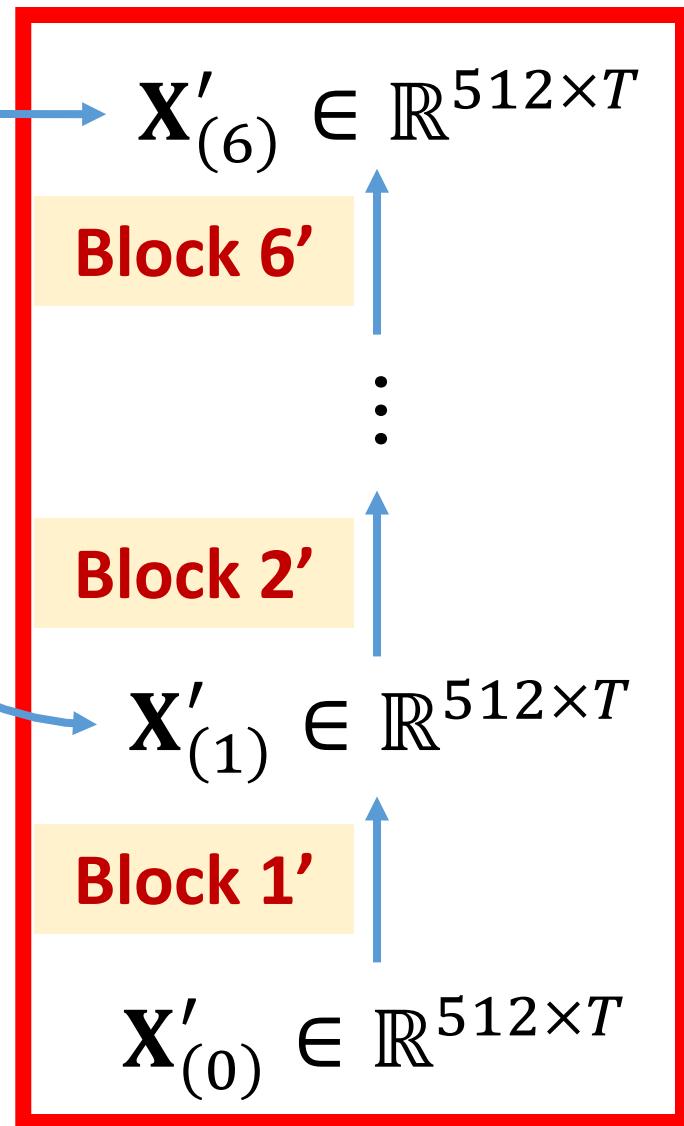

Decoder Network

Encoder

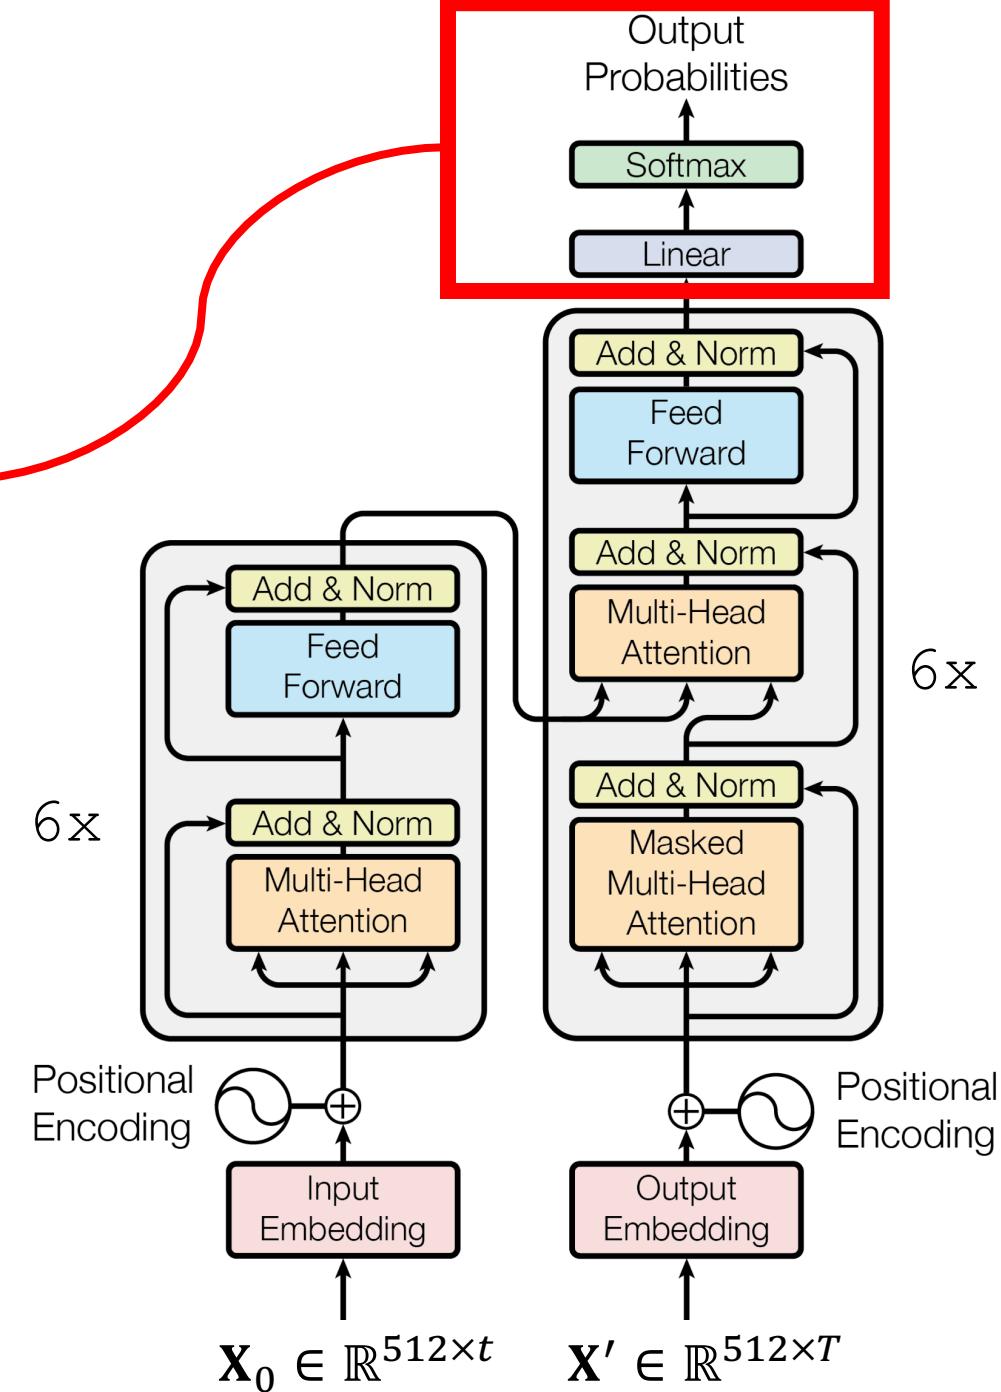

Decoder

Decoder Network

- Output a distribution over the vocabulary.
- Sample the next word according to the distribution.
- Append the new word's embedding to \mathbf{X}' .
- Run the decoder again, taking $\mathbf{X}' \in \mathbb{R}^{512 \times (T+1)}$ as input.

Summary

Summary

- Transformer model is **not RNN**.
 - Transformer is based on **attention** and **self-attention**.
 - **Upside:** Outperform all the state-of-the-art RNN models.
 - **Downside:** Much more expensive than RNN models.
-
- Read the original paper: Vaswani et al. [Attention Is All You Need](#). In *NIPS*, 2017.
 - Google “*transformer model explained*” and read the articles.

Key Concept: Multi-Head Attention

- Inputs: query \mathbf{Q} , key \mathbf{K} , and value \mathbf{V} .
- Linear maps: $\tilde{\mathbf{Q}} = \mathbf{W}_q \mathbf{Q}$, $\tilde{\mathbf{K}} = \mathbf{W}_k \mathbf{K}$, and $\tilde{\mathbf{V}} = \mathbf{W}_v \mathbf{V}$.
- Single-head attention:

$$\mathbf{C} = \text{attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V}) = \tilde{\mathbf{V}} \cdot \text{softmax}(\tilde{\mathbf{K}}^T \tilde{\mathbf{Q}}).$$

Key Concept: Multi-Head Attention

- Single-head attention:

$$\mathbf{C} = \text{attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V}) = \tilde{\mathbf{V}} \cdot \text{softmax}(\tilde{\mathbf{K}}^T \tilde{\mathbf{Q}}).$$

- Multi-head attention:

- Repeat $\text{attn}(\mathbf{Q}, \mathbf{K}, \mathbf{V})$ using different parameters $\mathbf{W}_q, \mathbf{W}_v, \mathbf{W}_v$.
- Get $\mathbf{C}^{[1]}, \mathbf{C}^{[2]}, \dots, \mathbf{C}^{[m]} \in \mathbb{R}^{d_z \times t}$.
- Concatenate the m matrices to get $\tilde{\mathbf{C}} \in \mathbb{R}^{md_z \times t}$.

Attention in the encoder:

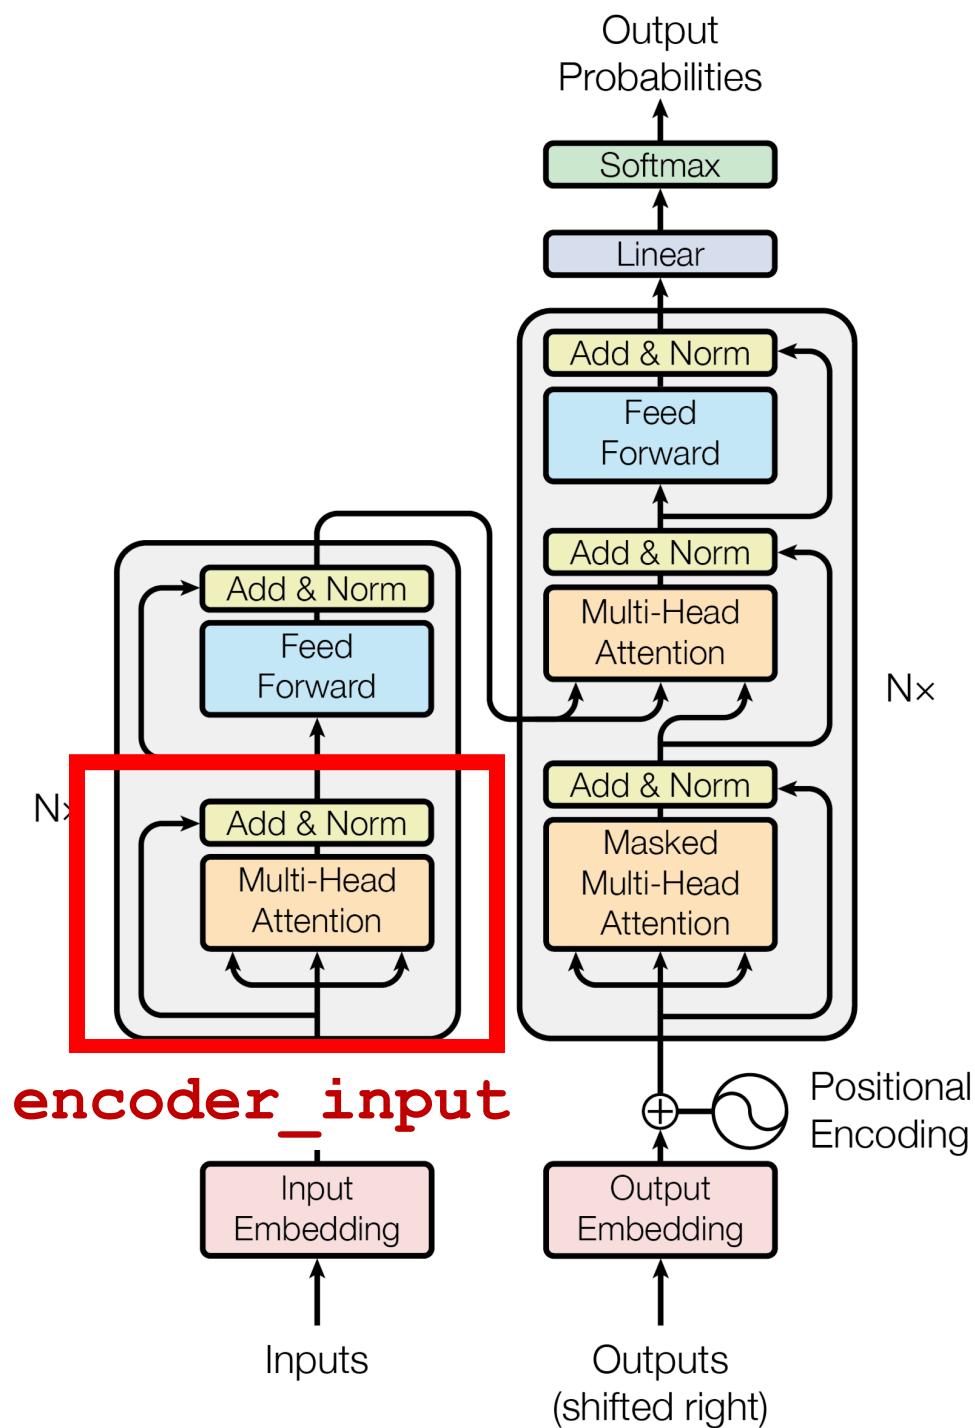

- $Q = K = V = \text{encoder_input}$.

1st attention in the decoder:

- $Q = K = V = \text{decoder_input}$.

2nd attention in the decoder

- $Q = \text{decoder_input}$
- $K = V = \text{encoder_output}$.

Attention in the encoder:

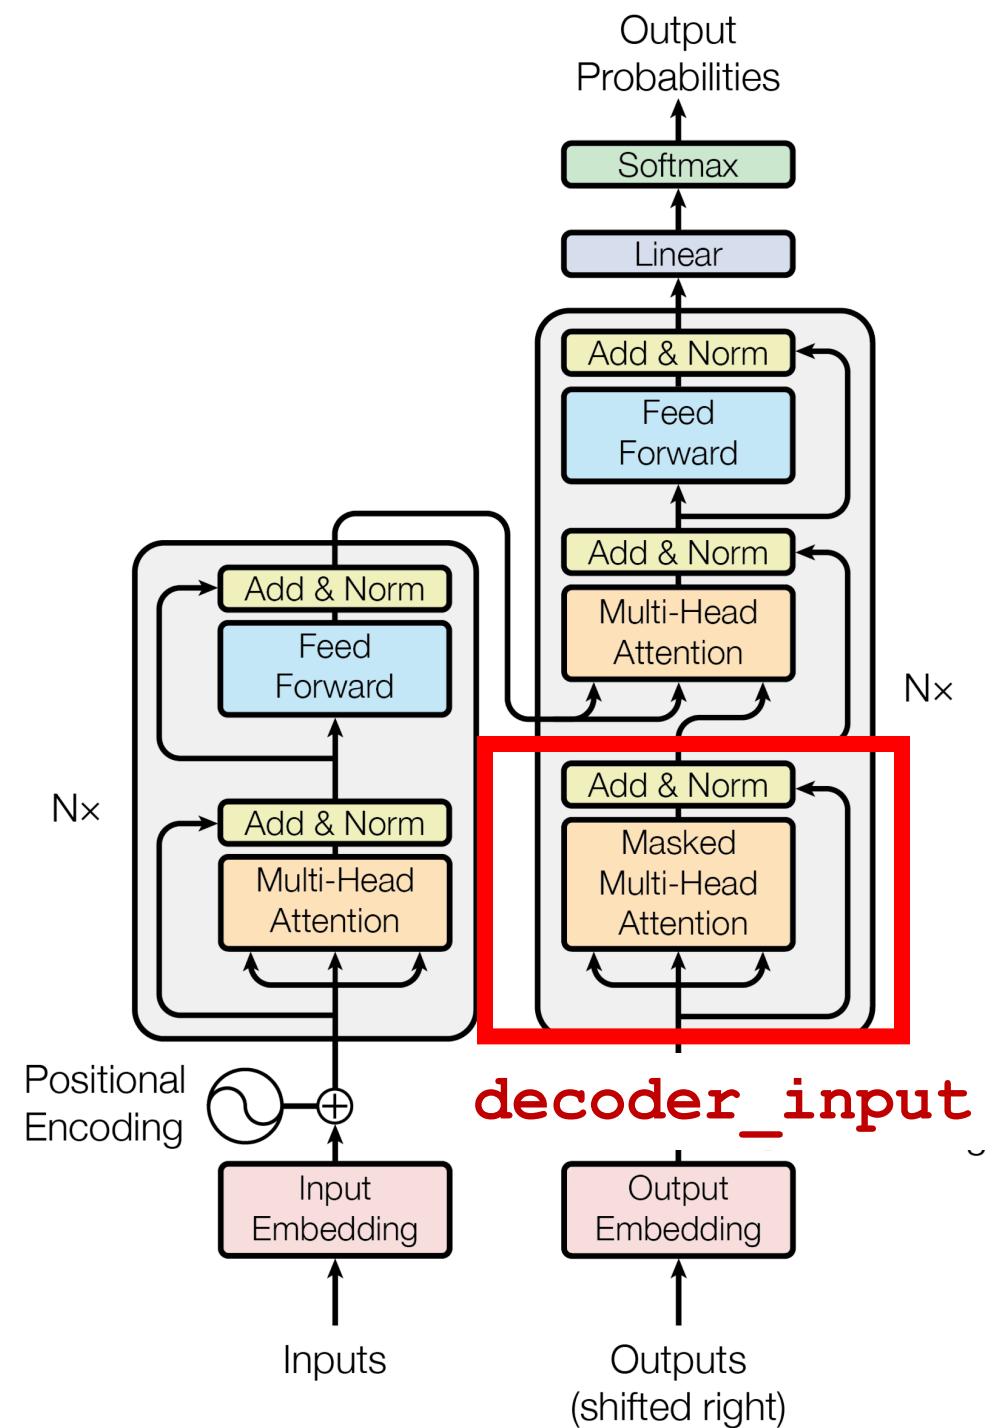

- $Q = K = V = \text{encoder_input}$.

1st attention in the decoder:
